Background: This study examines trends in late Hepatitis C virus (HCV) diagnosis and treatment in people diagnosed with end-stage liver disease (ESLD) in New South Wales (NSW), Australia.

Methods: HCV notifications in NSW, Australia (1995-2022) were linked to hospital admissions (2010-2021) and treatment records (2002-2022). Descriptive analyses and logistic regression were used to examine trends and factors associated with late diagnosis and missed treatment opportunities. Late diagnosis and treatment were defined by absence of HCV notification and HCV treatment within two years prior to or following first hospitalisation for ESLD.

Results: Among 4,419 people with an HCV notification and ESLD diagnosis, late HCV diagnoses decreased from 24% in 2010-2012 to 16% in 2019-2021, while the proportion receiving no or late treatment declined from 98% (85% no, 13% late) to 70% (48% no, 22% late) over the same period. Residing in rural or regional areas was associated with late HCV diagnosis (aOR 1.44, 95% CI 1.05-1.97, p=0.024). Recent injecting drug use (aOR 0.78, 95% CI 0.60-0.99, p=0.041), incarceration [distant (aOR 0.55, 95% CI 0.38-0.78, p=0.001), recent (aOR 0.51, 95% CI 0.28-0.96, p=0.037)], recent government assistance (aOR 0.57, 95% CI 0.39-0.82, p=0.002), and older age [\leq 1944 (aOR 0.31, 95% CI 0.15-0.66, p=0.002), 1945-1959 (aOR 0.47, 95% CI 0.29-0.77, p=0.003)], were associated with lower odds of a late HCV diagnosis. Recent alcohol use disorder was associated with increased odds of no or late treatment (aOR 1.80, 95% CI 1.40-2.32, p=0.001). Those born between 1945-1959 were less likely to have no or late treatment (aOR 0.58, 95% CI 0.34-0.98, p=0.041).

Conclusion: Encouragingly, factors associated with social marginalisation predict earlier HCV diagnosis, while rural/regional residence predicts late HCV diagnosis among people with ESLD. Missed HCV treatment opportunity, defined by no or late treatment is associated with alcohol use disorder, but not social marginalisation factors.

Disclosure of Interest Statement: The Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine and the 2025 Conference Collaborators recognise the considerable contribution that industry partners make to professional and research activities. We also recognise the need for transparency of disclosure of potential conflicts of interest by acknowledging these relationships in publications and presentations: Greg Dore reports research support from Gilead and Abbvie. Heather Valerio has received honoraria from Gilead Sciences. Jacob George received consulting fees from NovoNordisk, AbbVie, Gilead Sciences, BMS, Pharmaxis, Novartis, Cincera, Pfizer, Roche, NovoNordisk, Eisai and Bayer. Jason Grebely has

received research grants from AbbVie, Biolytical, Cepheid, Gilead and Hologic, and has received honoraria from AbbVie, Abbott, Cepheid, Gilead and Roche outside the submitted work. Marianne Martinello has received consulting fees from Abbvie.

Kathy Petoumenos reports grants from Gilead Sciences and ViiV health care. Gail Matthews reports grants from ViiV and Janssen, received honoraria from ViiV and Gilead and participated on a Data Safety Monitoring Board for ViiV. All remaining authors have no potential conflicts to declare.
