

## **HPV Vaccination in people living with HIV**

HPV vaccination is an effective primary prevention method to avoid HPV-related morbidity and mortality. This talk will explore the evidence for the role of HPV vaccination among people living with HIV, including the evidence of immunogenicity, safety, population impact on HPV-related cancers and whether it is 'too late' for people living with HIV to receive vaccination.

**Learning objective:** Participants will understand whether there is value in offering HPV vaccination to people living with HIV.
