Advanced HIV diagnoses among Australian GBM 2007-2016

Disclosure of interest

- I have no conflicts of interests to declare

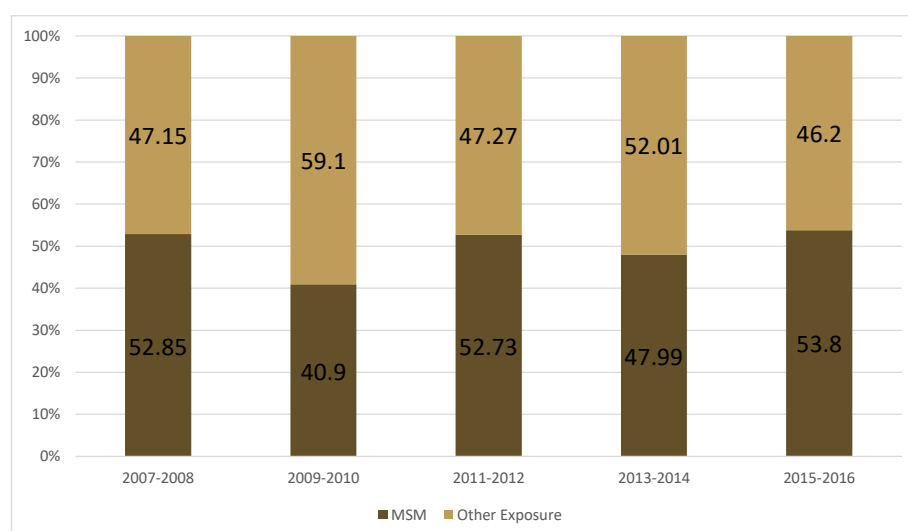

Definitions

- **Advanced** HIV infection (CD4+ <200 cells/ μ l)
 - ~8 years following seroconversion (*Lodi, CID, 2011*)
- **Late** HIV diagnoses (CD4+ = 200-349 cells/ μ l)
 - ~4 years following seroconversion (*Lodi, CID, 2011*)
- Excludes cases with evidence of primary HIV infection (<12 months) and seroconversion illness

3

Why focus on gay and bisexual men (GBM)?

Advanced HIV diagnoses by exposure category

~50% of advanced diagnoses are among GBM

Late and Advanced HIV Diagnoses - Impacts

- Strongly linked to increased mortality and morbidity, and reduced life expectancy (*Mocroft, PLOS 2013; Nakagawa, AIDS, 2012; Sabin, Stocle, HIV Medicine 2012*)
- Higher costs to health systems (*NAT, Commissioning HIV Testing Services in England 2014*)
- People with undiagnosed HIV infections may unwittingly transmit to others

Barriers to testing

- **Low perceived risk of infection** (*Opstal, AIDS and Behav. 2018; Gianacas, Kirby Institute 2013*)
- **Fear of an HIV diagnosis** (*Opstal, AIDS and Behav. 2018; Gianacas, Kirby Institute, 2013*)
- **Missed clinical opportunities for HIV diagnosis** (*Opstal, AIDS and Behav. 2018; Mallitt 2015*)

8

Methods

- **National HIV surveillance data 2007-2016**
 - Gay and bisexual men (MSM)
- A multivariate logistic regression model was used to identify the factors associated with advanced diagnoses (<200 CD4+ cells/ μ l)
- Population-attributable risk analysis of contributions to advanced diagnoses

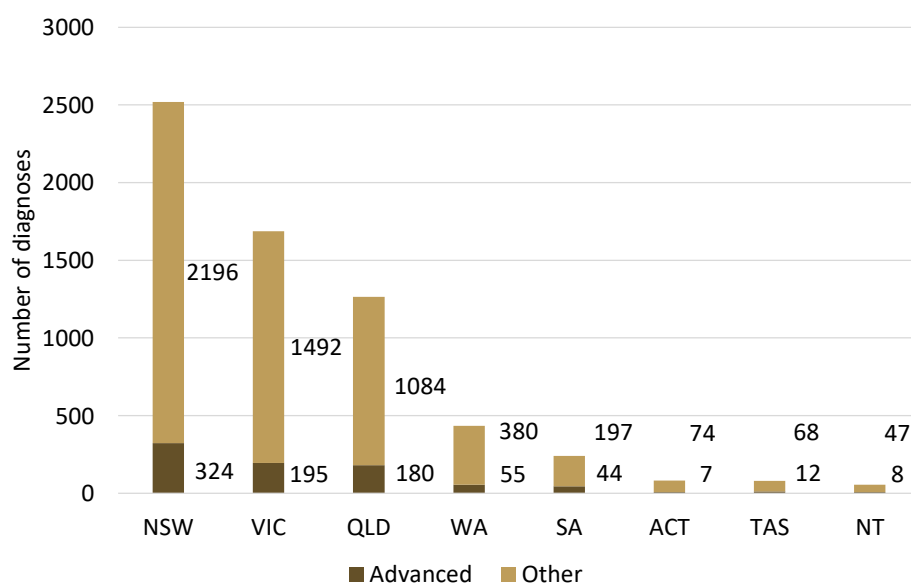

9

Year of diagnosis

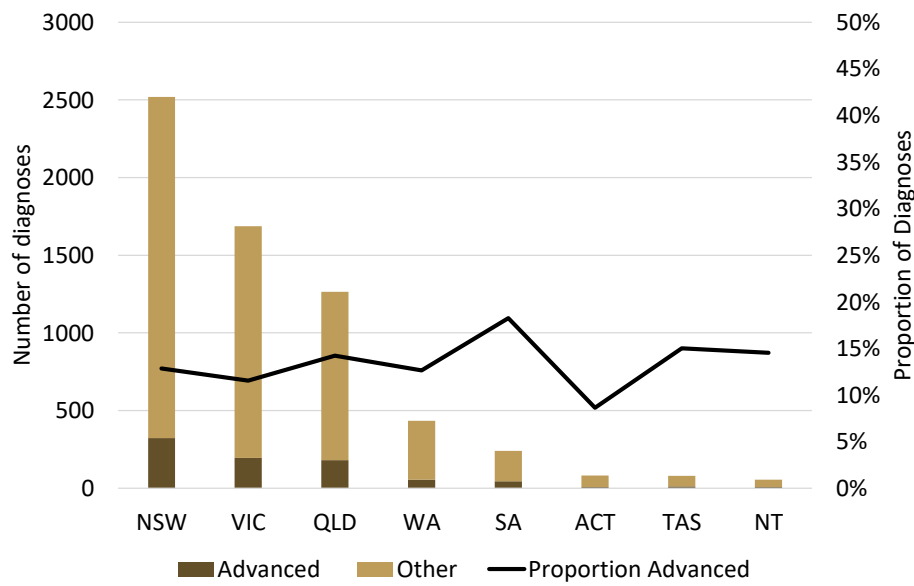

No significant trend

State/Territory

State/Territory

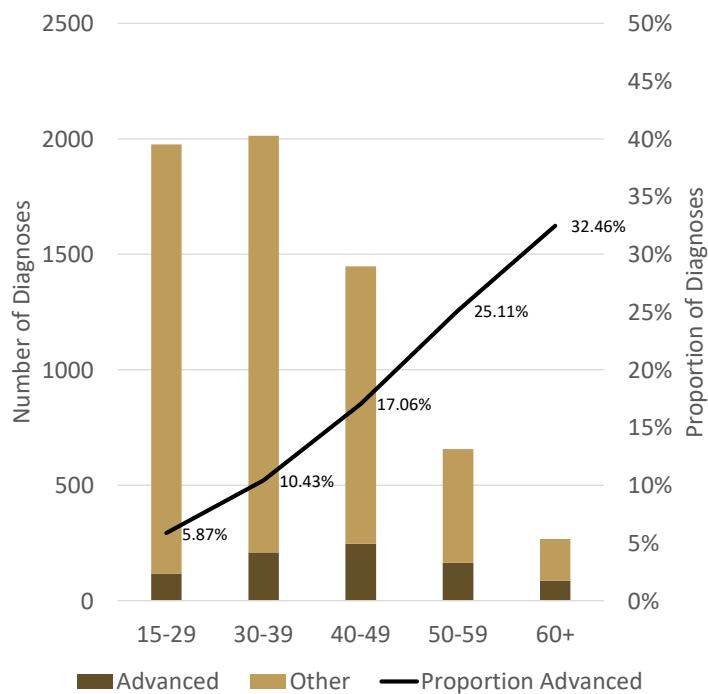

Not significant in multivariate analysis

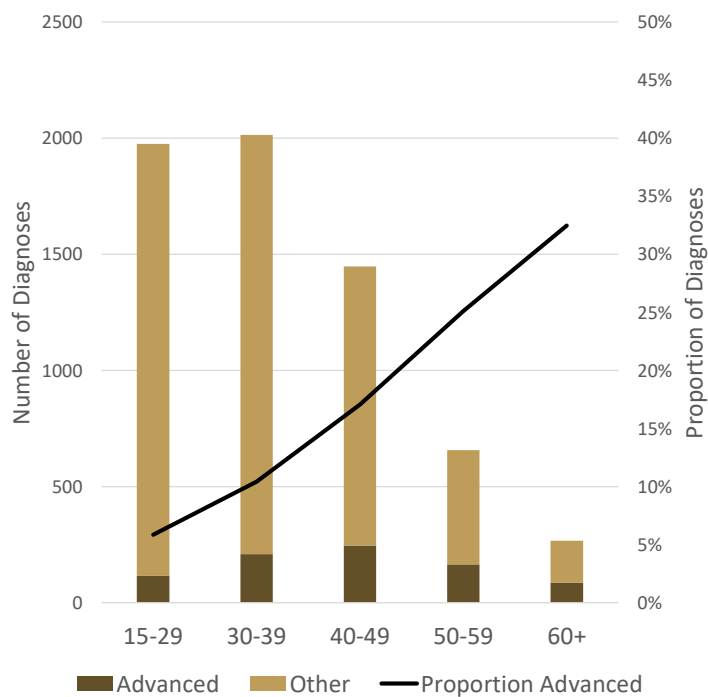

Age

Age

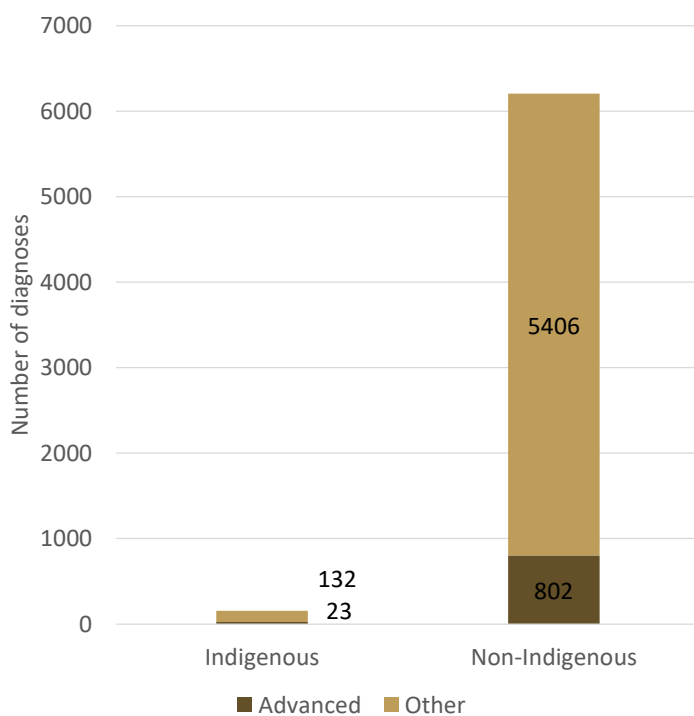

Advanced HIV diagnoses by age

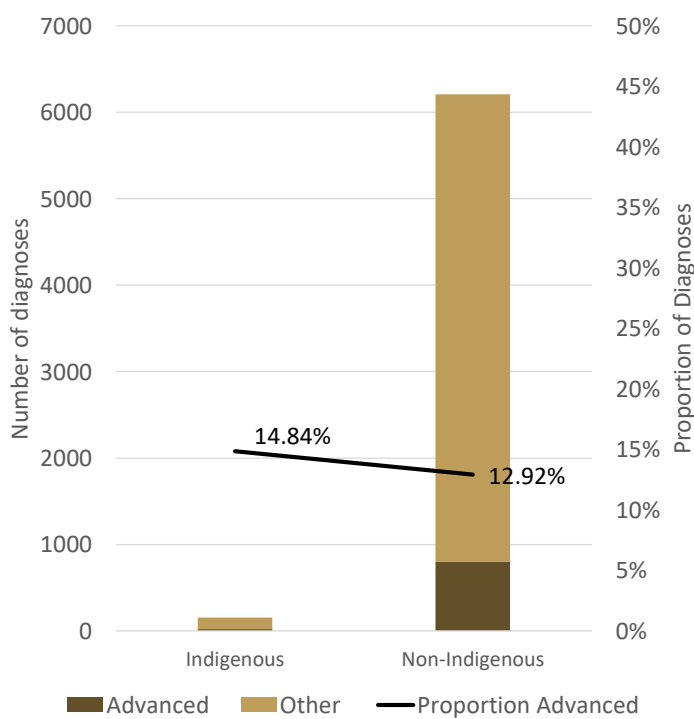

Age	aORs
30-39	1.89
40-49	3.49
50-59	5.78
60+	8.43

Indigenous Status

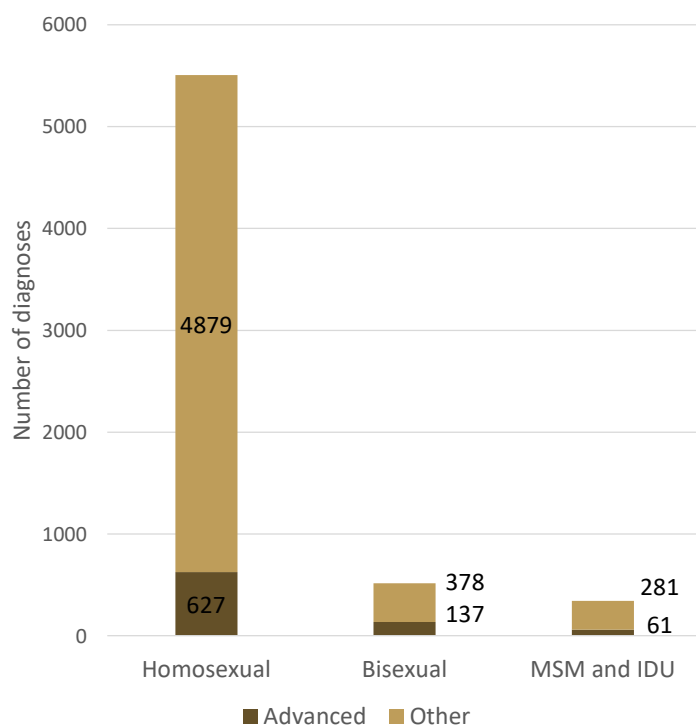

Indigenous Status

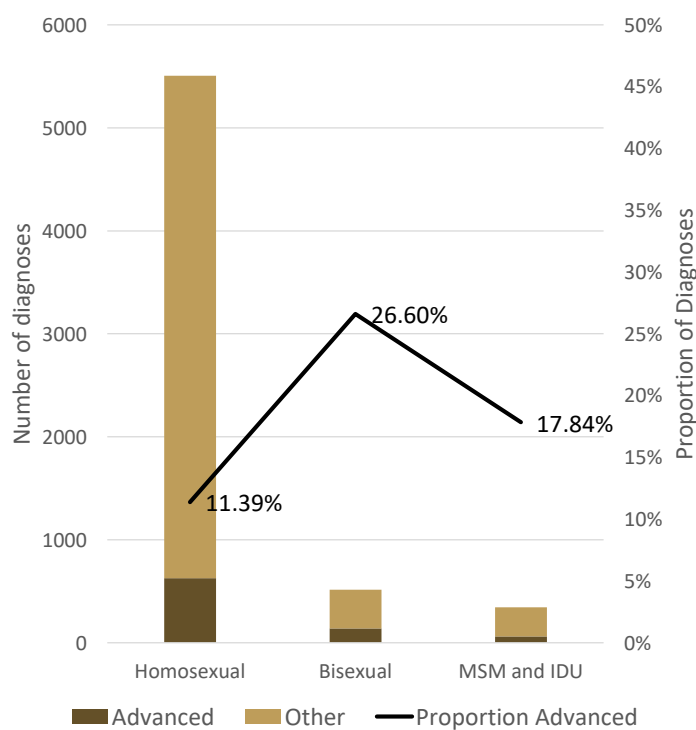

Indigenous status	aOR
Indigenous	1.17

Not significant in multivariate analysis

HIV Exposure

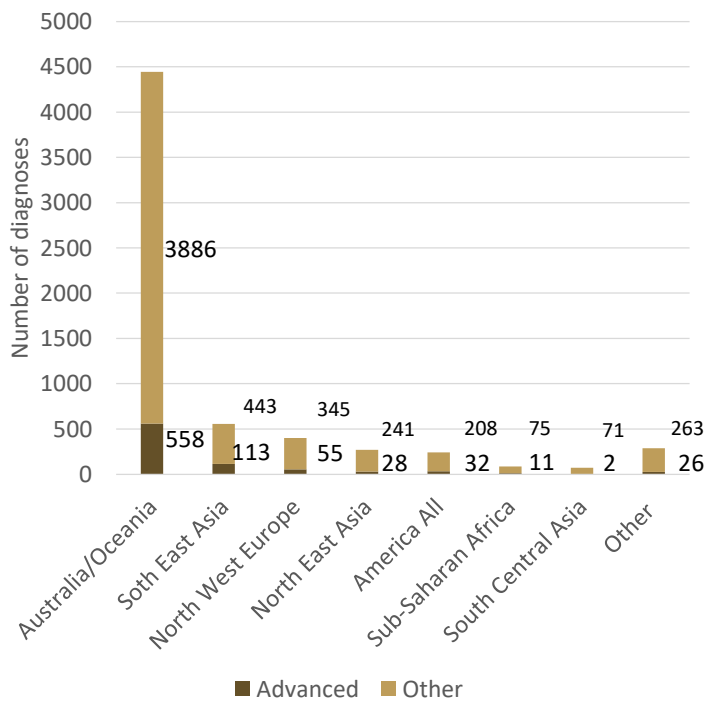

HIV Exposure

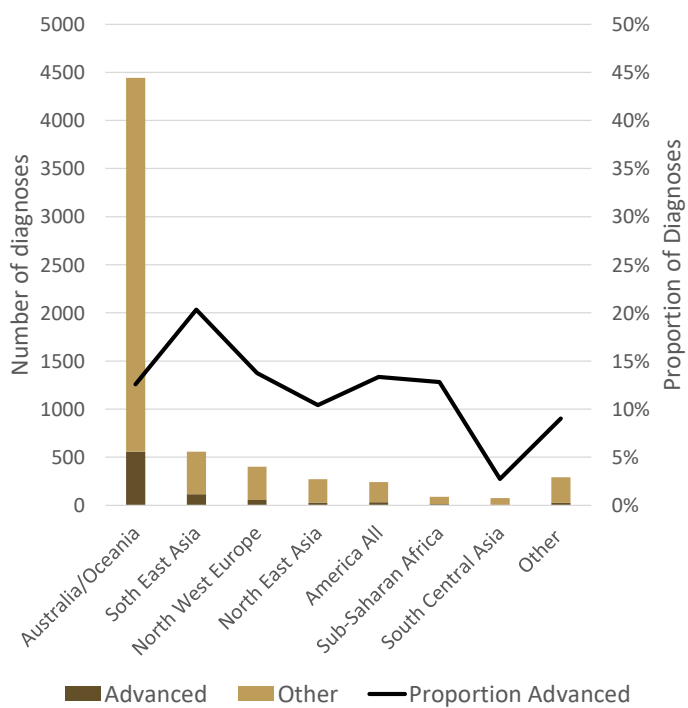

Exposure	aORs
Bisexual	2.41
MSM + IDU	1.76

Region of birth

Region of birth

Region	aORs
SE Asia	2.63
NE Asia	1.35
SC Asia	0.20

Population-attributable risk

Results – Population-attributable risk

- 70% of advanced HIV diagnoses were associated with factors significant in the multivariate analysis
 - Age
 - Exposure
 - Region of birth

Conclusions (1)

- Advanced HIV diagnoses among GBM are associated with a small number of factors:
 - Age: 30-39, 40-49, 50-59, 60+
 - Exposure: Bisexual, MSM + IDU
 - Region of birth: South East Asia and North East Asia
- Men with these characteristics account for most advanced infections among GBM

25

Conclusions (2)

- Year of diagnosis was not associated with advanced diagnoses; advanced diagnoses are stable and persistent.
- Testing strategies should be tailored to reach the sub-populations most at risk of advanced HIV diagnosis.
- Greater attention to clinical opportunities for HIV diagnosis; clinicians *offering* HIV testing.

26

Limitations

- State/territory of residence was based on the residence of a person at the time of testing, and does not reflect where HIV was acquired.
- Prior to 2014/15 data on the date of CD4+ count and clinical status at diagnosis are incomplete in the National HIV Registry.
- Bisexual exposure may be under-reported.

27
