

# Effects of Novel Soil Amendments on Nutrient Leaching in a Sand

Richard Bell, Simon Yeap and Karthika Pradeep

23 July 2025

Performance through collaboration

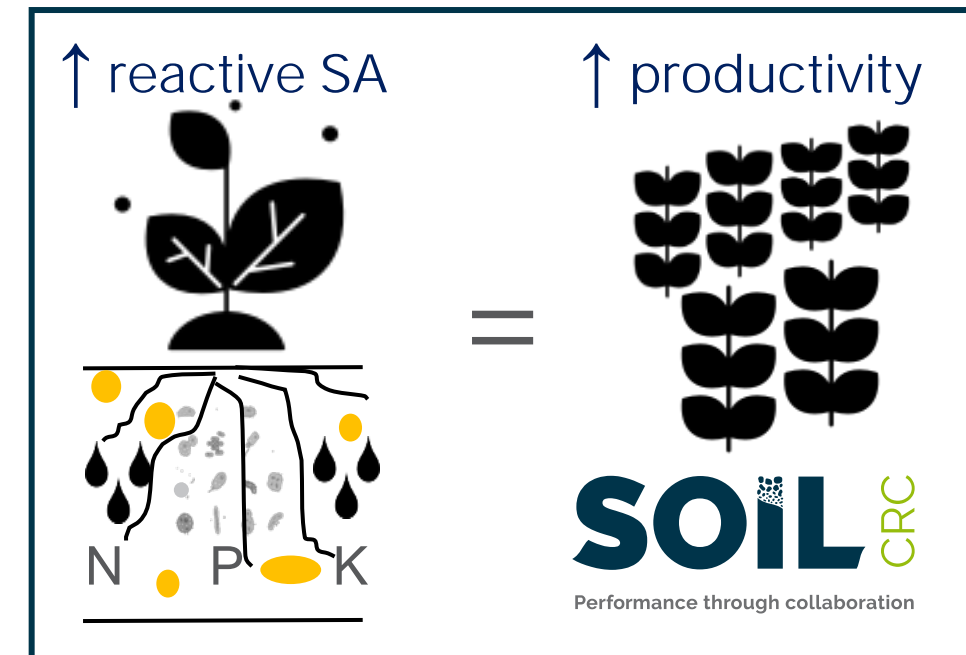

# Sandy soils often have multiple limitations

- these need to be addressed before an increase in productivity and OC can be expected

High performance sandy soils =  
increase reactive surface area with  
added clay and/or organic material

Design by Amanda Schapel

# SANDY SOIL AMELIORATION TECHNIQUES

# LITERATURE REVIEW

## Topics Covered

- Characterising sandy soil
- Production influences
- Challenges to sandy soils and how they can be overcome
- Review sandy soil amendments (organic amendments and clay) and effects on yield and OC
- Novel products identified- industrial waste, minerals, organic, super-absorbent and micronised polymers

## 19 Sandy Soil Constraints *Organic and Clay Amendments to Improve the Productivity of Sandy Soils*

*Amanda Schapel<sup>1</sup>, Richard Bell<sup>2</sup>, Simon Yeap<sup>2,3</sup>,  
and David Hall<sup>4</sup>*

# MAPPING AND GROUPING OF SANDS

Nathan Robinson and Rick Pope, Federation University Australia

| State             | Area (ha) of sandy soils in agricultural land | % of agricultural land in state |
|-------------------|---|---------------------------------|
| Western Australia | 10,611,418                                    | 51.3                            |
| South Australia   | 2,479,772                                     | 22.8                            |
| New South Wales   | 1,867,352                                     | 4.1                             |
| Victoria          | 864,944                                       | 6.9                             |
| Tasmania          | 215,526                                       | 17.7                            |
| National          | 16,039,012                                    |                                 |

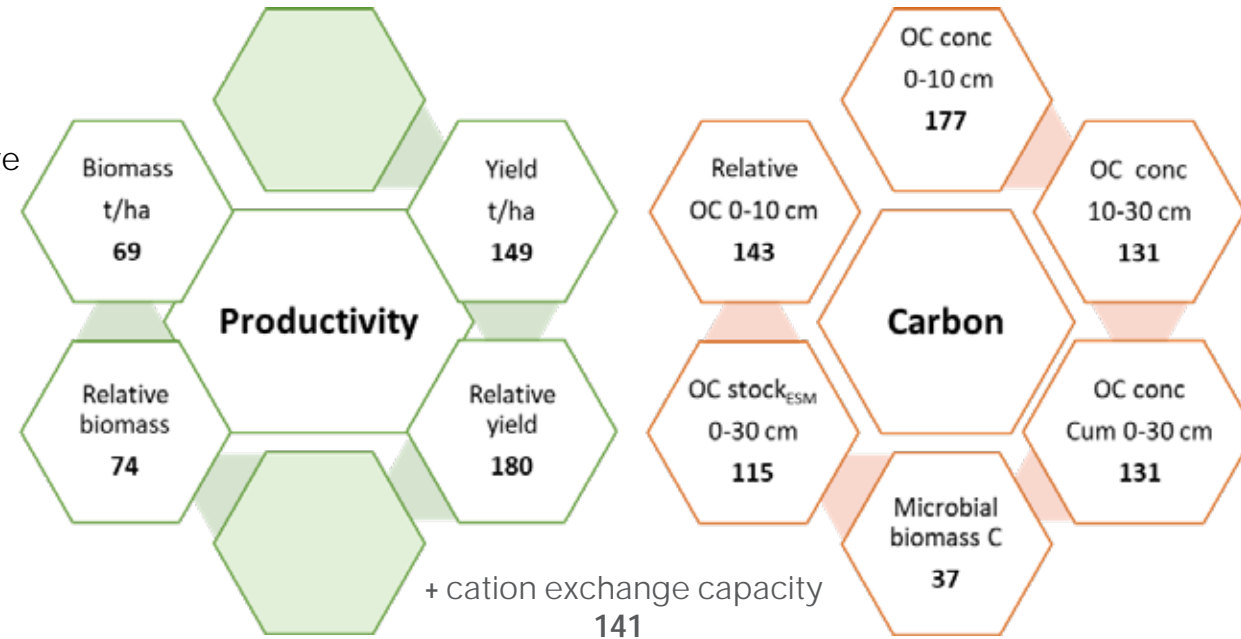

# META-ANALYSIS

89 projects - 270 records

Soil depths

Key variables assessed

## Analysis

- Linear regression, coefficients recorded where  $P < 0.05$  for 180 variables
- Top 10 factors for key variables – ‘influencing factors’
- Grouped data for influencing factors

# What novel amendments can improve properties of sands by suppressed leaching?

**soil**  **CRC**

Performance through collaboration

# COLUMNS

- 2 irrigation regimes:
  - ✓ low (33.4 mm), high irrigation regime (42.8 mm).
- 10 irrigation events every 4 days, equivalent to the 25<sup>th</sup> (334 mm) and 75<sup>th</sup> percentile (428 mm) of annual rainfall at Meckering
- Granular fertiliser at 2 cm depth
- 50 N, 21 P, 58 K, 5.0 Mg, 41 S, 0.4 Zn, 0.1 B, 0.3 Mn, and 0.1 Cu mg/kg
- soil bulk density -1.6 g/cm<sup>3</sup>

# AMENDMENT TREATMENTS

- Sand control
  - Compost pellets (from Carbon Ag Solutions WA)
  - Compost ground
  - Zeolite rock (4-6 mm; Zeolite Australia, NSW)
  - Zeolite ground
  - Spongolite (0.5-2 mm; Southern Spongolite Industries, WA)
  - Rescaype (sodium acrylate/acrylamide copolymer; MIBA Rescaype AB, Sweden).
- 
- Compost, zeolite, and spongolite applied at equivalent to 20 t/ha,
  - Rescaype applied at recommended rate of 10 kg/ha.

Meckering  
sand

Sand 96 %  
Silt 3 %  
Clay 1%

| Properties  | Soil | Zeolite | Compost | Spongolite |
|---|------|---------|---------|------------|
| pH (CaCl <sub>2</sub> )                             | 6.7  | 6.2     | 7       | 4.5        |
| Organic carbon (g/kg)                               | 0.64 | <0.5    | 51.6    | 1.3        |
| Min-N (mg/kg)                                       | 13   | 31      | 204     | 8          |
| Colwell P (mg/kg)                                   | 10   | 3       | 952     | 3          |
| Colwell K (mg/kg)                                   | 24   | 634     | 8974    | 444        |
| S (mg/kg)   | 1.9  | 4       | 6501    | 579        |
| B (mg/kg)   | 0.15 | 0.1     | 6.4     | 2.39       |
| Cu (mg/kg)  | 0.56 | 0.26    | 11.6    | 2.08       |
| Fe (mg/kg)  | 11.6 | 5.8     | 41.4    | 20         |
| Mn (mg/kg)  | 3.3  | 4.82    | 117     | 0.62       |
| Zn (mg/kg)  | 0.77 | 0.44    | 151     | 0.88       |
| Ex. Ca (cmol(+)/kg) <sup>Δ</sup>                    | 1.51 | 9.38    | 73.9    | 1.64       |
| Ex. Mg (cmol(+)/kg) <sup>Δ</sup>                    | 0.2  | 1.95    | 17      | 6.22       |

# Leachate volumes

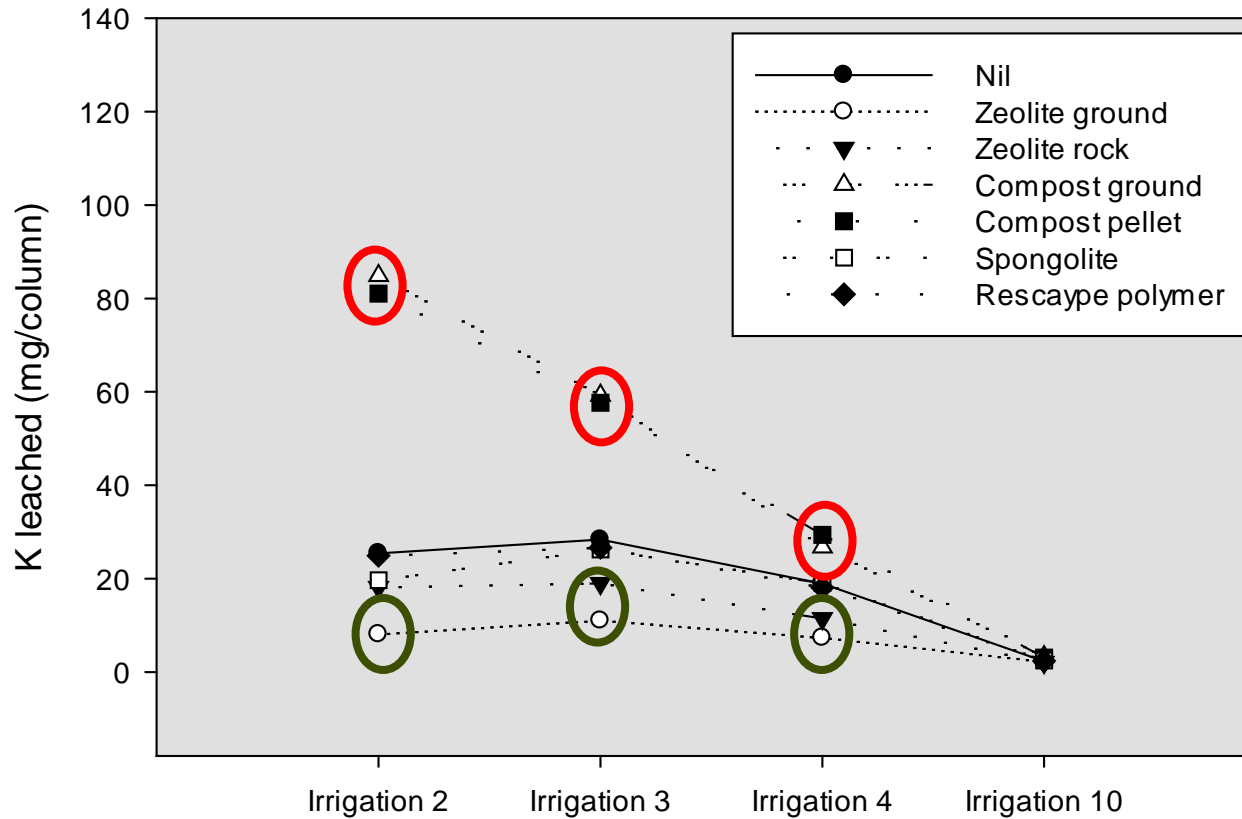

# P LEACHED OVER TIME

# K LEACHED OVER TIME

K leached in low irrigation regime

K leached in high irrigation regime

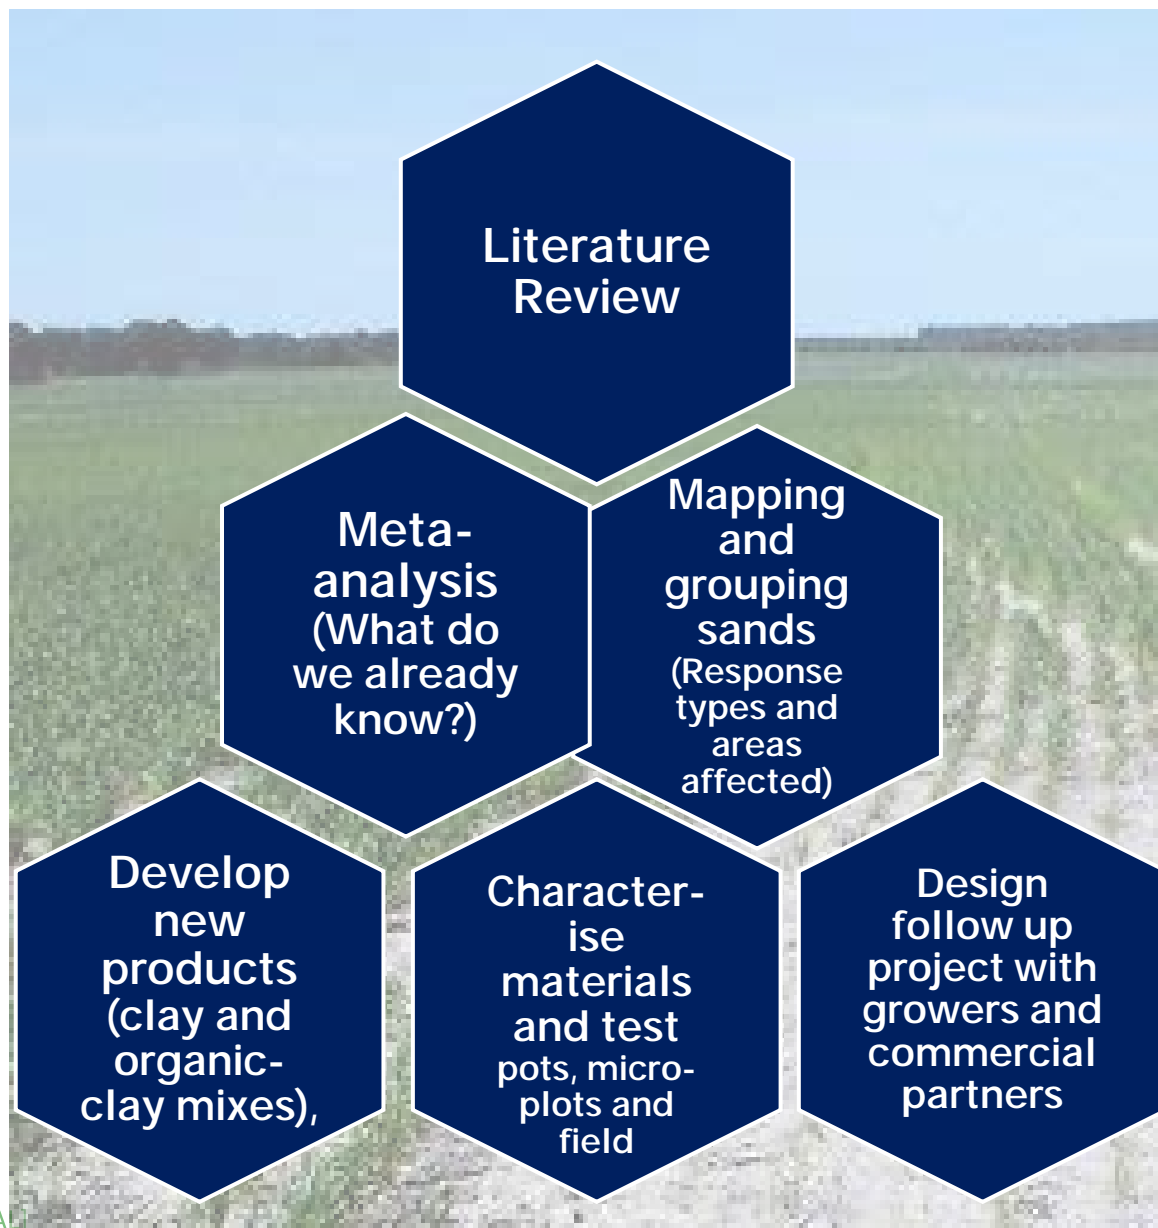

# CONCLUSIONS

- Zeolite most promising for water retention, and decreased leaching of cations and P
- Compost had mixed effects, lowering leaching volumes but increasing loss of N, K, Ca, Mg, S
- Hydrotalcite – promising for P retention in other studies
- Bentonite – product may have high Na, B
- Polymer – no benefits under adequate water supply
- Field evaluations in long term experiments underway

# PROJECT ACTIVITIES

How do we permanently increase the reactive surface of sandy soils?

- Literature review
  - What can we learn from previous work on addition of organic matter and clay to sandy soils?
  - What novel products have been used in Australia and globally
- Meta-analysis will assess current benefits
- Select and evaluate novel products

# META-ANALYSIS

Amanda Schapel SARDI, Richard Bell Murdoch University

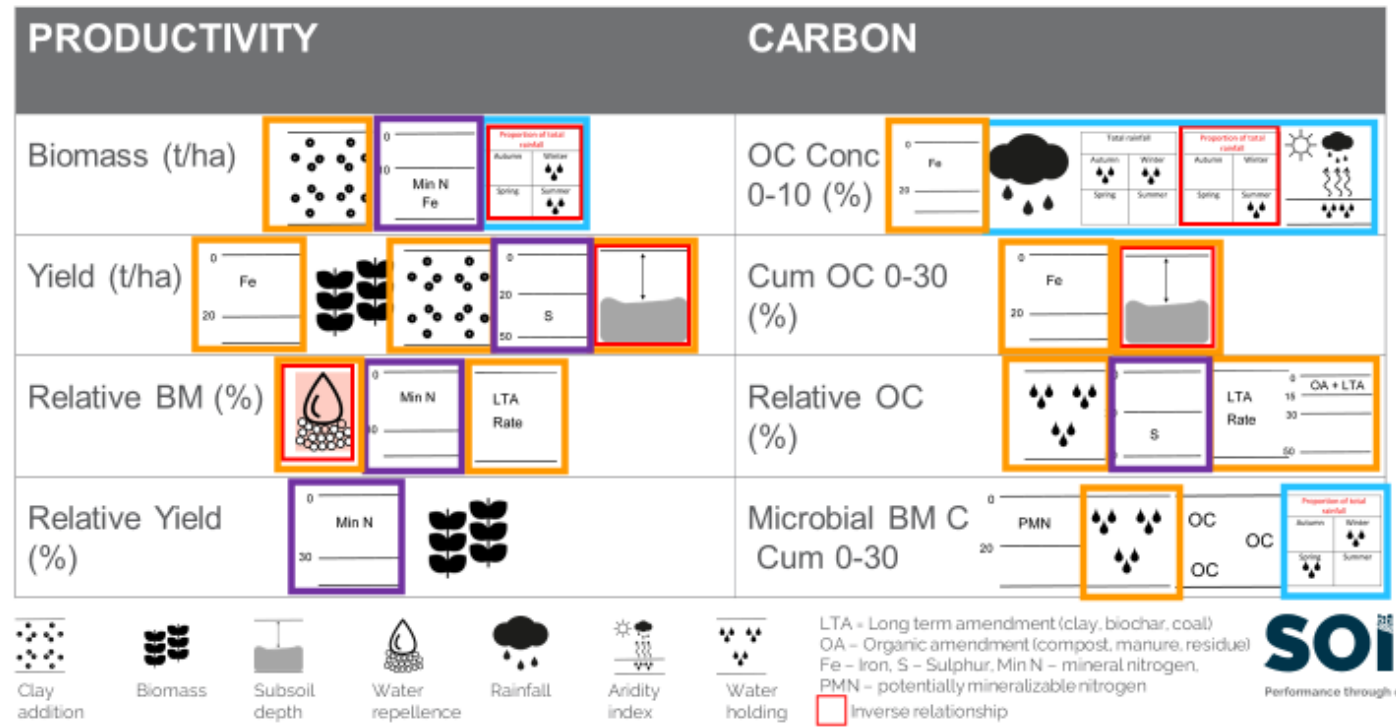

- long-term assessment of clay and organic amendments in relation to the productivity and carbon concentration of sandy soil
- examine the factors that influence productivity and OC

[https://www.youtube.com/watch?v=mrbxSXmX5Q8&t=8s&ab\\_channel=SoilCRC](https://www.youtube.com/watch?v=mrbxSXmX5Q8&t=8s&ab_channel=SoilCRC)

## M-A CORRELATIONS

Climate Soil Nutrition

# STRATEGY FOR BUILDING SOIL ORGANIC CARBON AND CO-BENEFITS IN DEEP SANDS

- Add compost/ biochar (e.g. FOGO-based products)
- Add clay (to stabilise carbon in sands)
- Incorporate to depth (to store more carbon than topsoil)
- Grow biomass (to provide continuous carbon inputs)
- Minimum soil disturbance (to slow decomposition of soil carbon)
- Maintain soil cover (lower soil temperature)
