## Misinformation Plays a Significant Role in Vaccine Reluctance

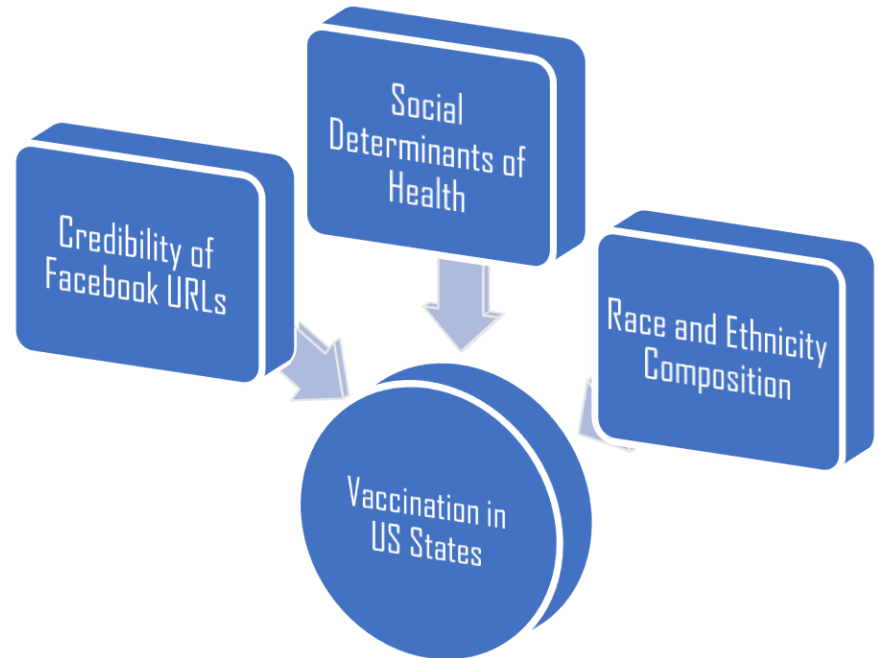

High probability of encountering  
misinformation

## What kind of sources are shared on social media?

<https://...>

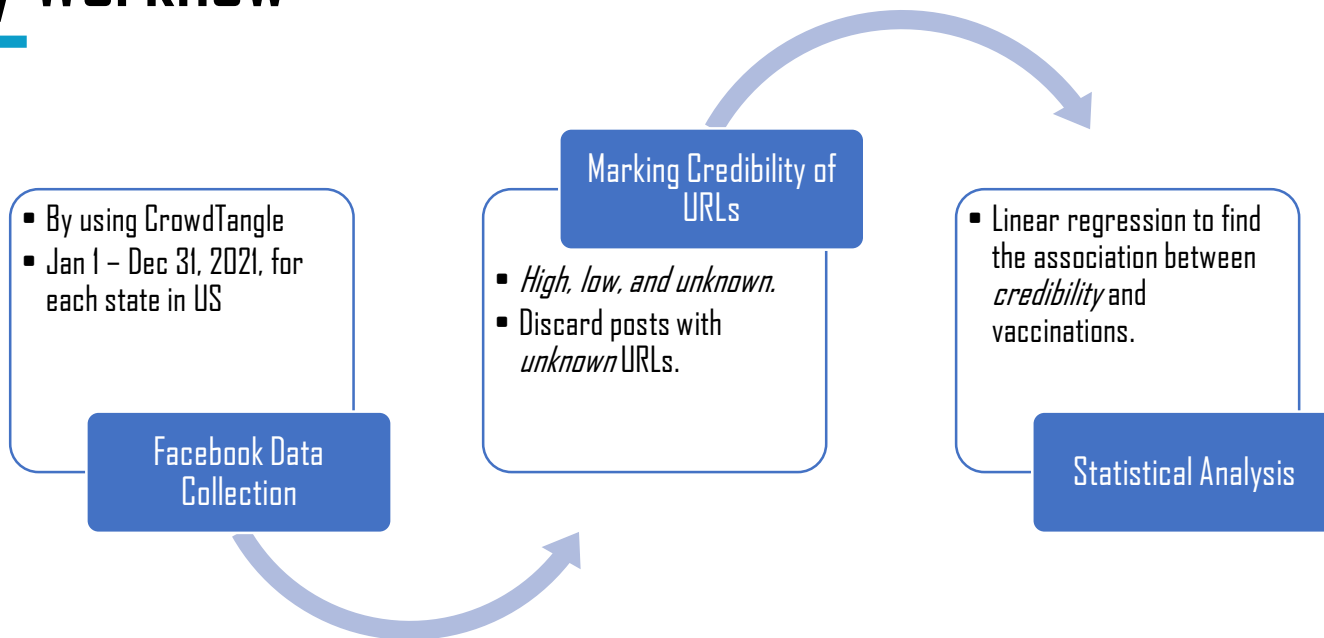

## Hypothesis

- *States in the US with more Facebook posts with low-credibility sources and fewer posts with high-credibility sources tend to have lower vaccination rates.*

## Study Workflow

## Facebook Data Collection

- CrowdTangle [1].
- Select vaccine-related posts in English for each US state in 2021 filtering based on CoVaxxy keywords [2].
- Collected ~859K posts that contained URLs other than [www.facebook.com](https://www.facebook.com).

## Credibility of URLs in Facebook Posts

Utilizing the Iffy+ Misinfo/Disinfo list created by Iffy.news [3].

Three labels: *high*, *low*, *unknown* (discarded from analysis).

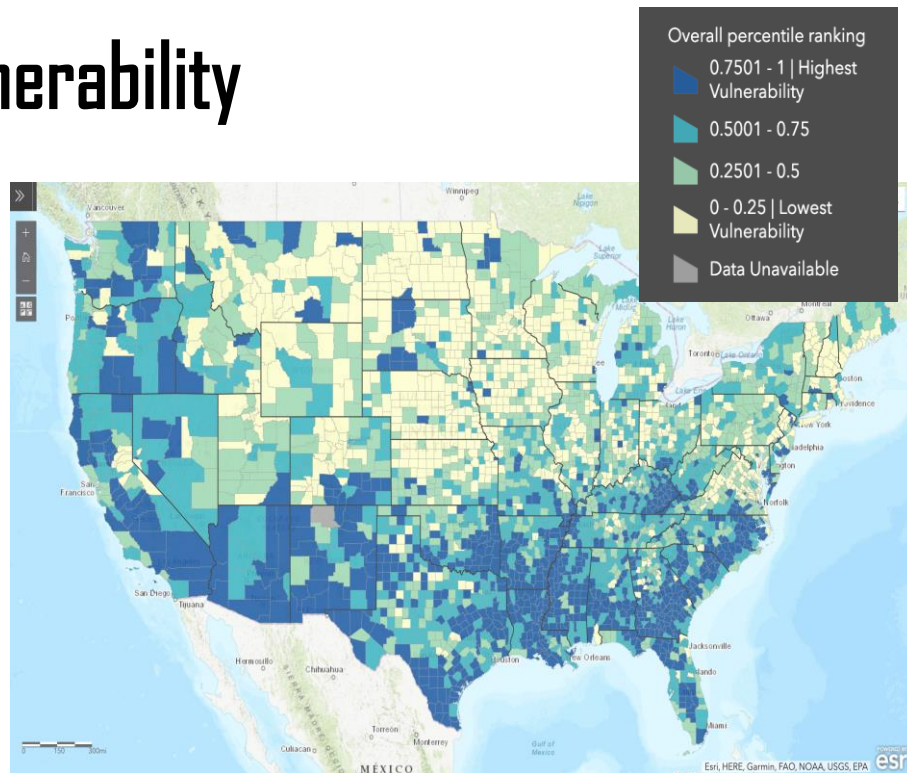

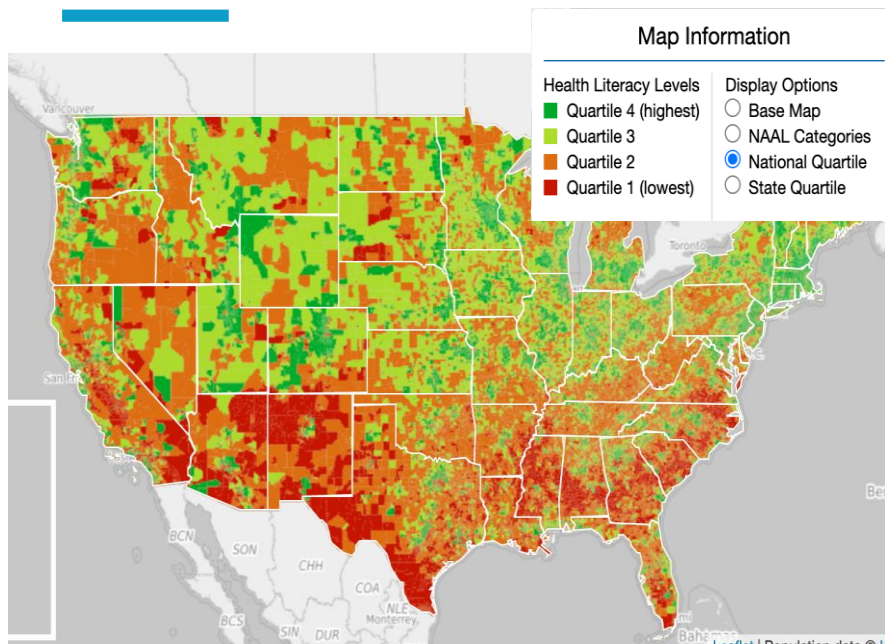

9.1% of sources were with high-credibility while 0.9% of sources were with low-credibility.

Final dataset: ~96K posts containing ~64K unique URLs.

## Health Literacy and Social Vulnerability

## Statistical Analysis

### Dependent Variable:

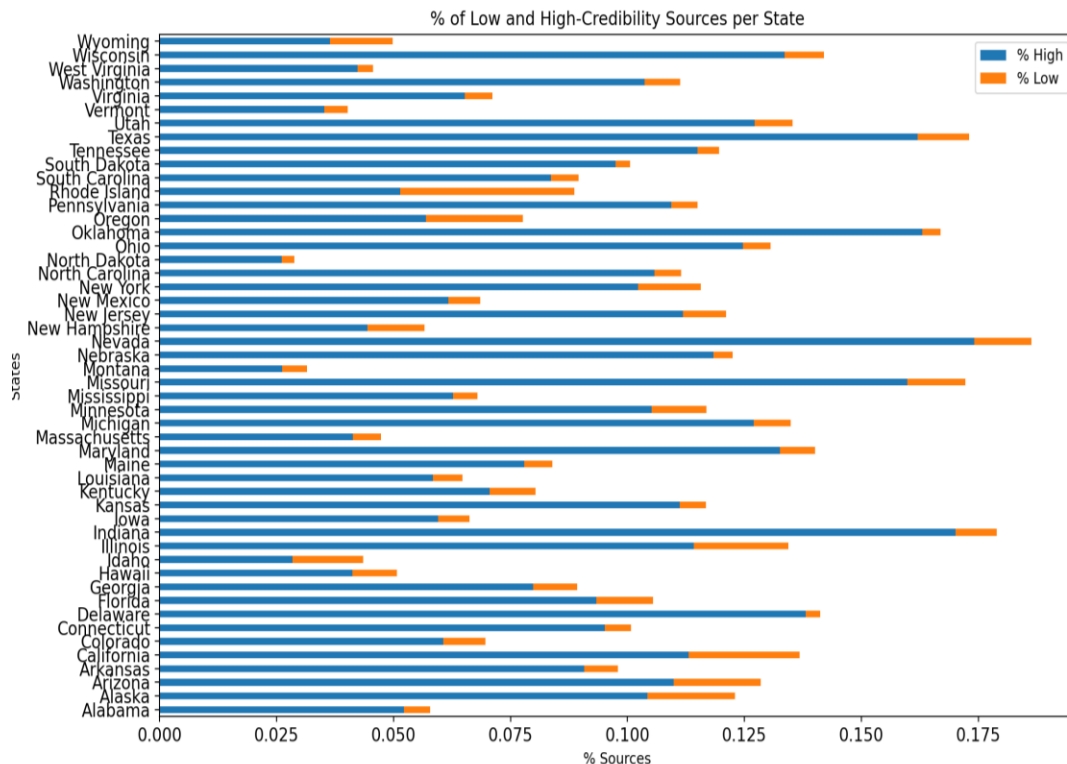

- New weekly vaccinations

### Independent Variable:

- Credibility (*low or high*)

### Control Variables:

- Health Literacy (HL)
- Social Vulnerability Index (SVI)
- Race/Ethnicity Composition [6]

## Results

**Table 1.** Results from Linear Regression model where standard errors were clustered per state and week.

Variable	Estimate	Std. Error	P- value
<b>Credibility - Low</b>	<b>-0.41</b>	<b>0.09</b>	<b>P &lt; 0.001</b>
HL	0.03	0.06	0.6
SVI	-1.56	1.09	0.15
Hispanic Population (%)	1.9	1.24	0.13
Black Population (%)	0.07	1.35	0.96
Asian Population (%)	-0.002	2.61	0.99

## Conclusion

---

The study showed an association between post credibility on Facebook and new weekly vaccinations at the state level in the US.

The analysis might suggest that social media users in some locations do not distinguish between low and high-credibility sources.

Results emphasize the relevance of social media listening to help overcome future emergencies.
