

## COVID-19

## Effectiveness of clinical management of COVID-19 based on structured clinical knowledge and process paths

Satoko TSURU

Professor

*The University of Tokyo*

## 1. Introduction

- In hospitals, it takes time to train medical personnel, it is important to at least prevent existing medical personnel, **especially nurses, from leaving their jobs.**
- We have developed a clinical management system based on structured clinical knowledge and process paths, which aims to reduce the levels of disruption and stress pandemics cause in hospitals.
- **The purpose of this study was to analyze the effectiveness of this system.**
- In this paper, the effectiveness of the system was examined after its implementation by **focusing on the turnover rate of nursing staff.**

## 2. Methods *Infrastructure enhancement (2017-2019): development of a clinical process support system using structured clinical knowledge and its implementation in hospitals*

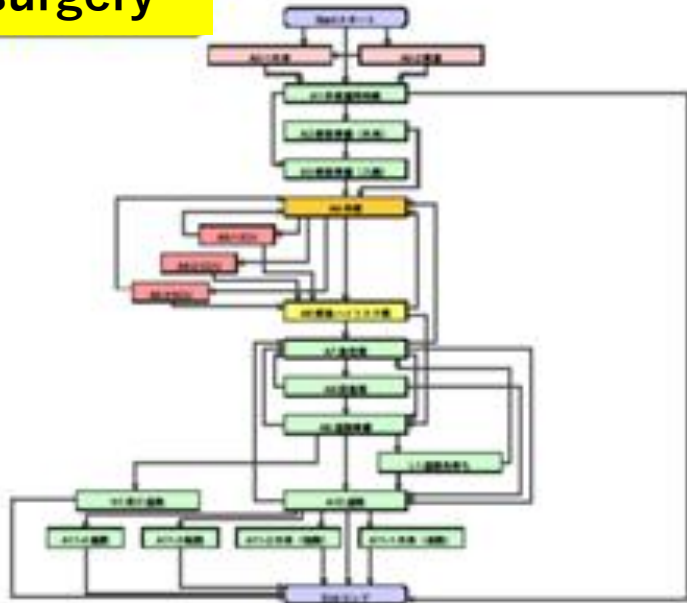

- Since 2004, Tsuru, Iizuka et al. have been developing a clinical pathway system, incorporating structured clinical knowledge (PCAPS).
- In 2018, Nakao, Tsuru, et al. developed an IT application and implemented it in hospital S (350 beds).
- Tsuru, Tamamoto, Nakao et al. developed system, which was named Team Compass with PCAPS, was implemented in hospital N (900 beds, a university hospital) in May 2019. As a result, 730 process paths were typified at the university hospital. Structured clinical knowledge relating to nursing was incorporated into each of the units that made up the process paths.

- Reduction of nurses' overtime hours for recording using these digital path contents and the application.
  - ✓ 27% at a 900-bed university hospital
  - ✓ 40-50% at a 400-bed general hospital

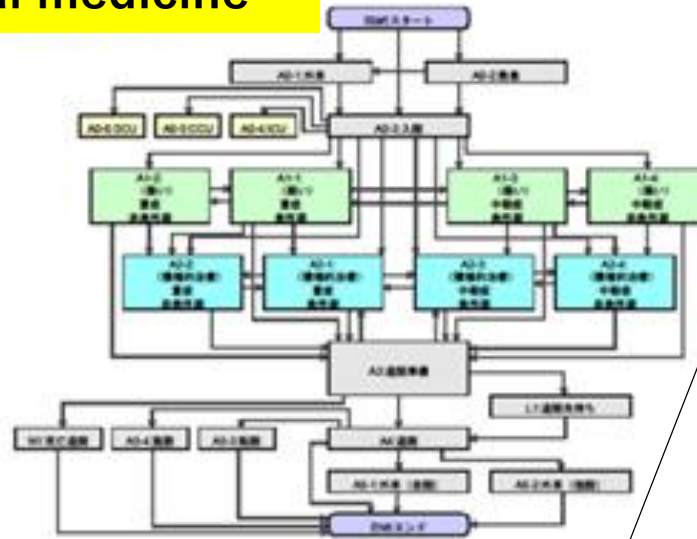

# Step 1 : Process Path Design

➤ **Generalization/Familiarization of PCAPS contents for implementation**

surgery

internal medicine

Short term admission

Management for parallel patient condition

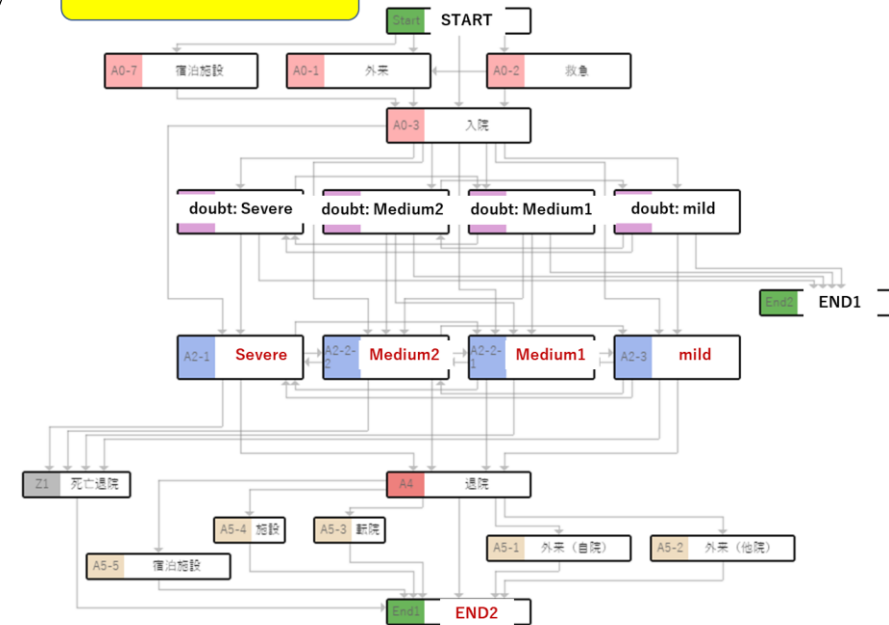

**Event:** Event to inhibit medical treatment

● **Red: Medical Doctor event**

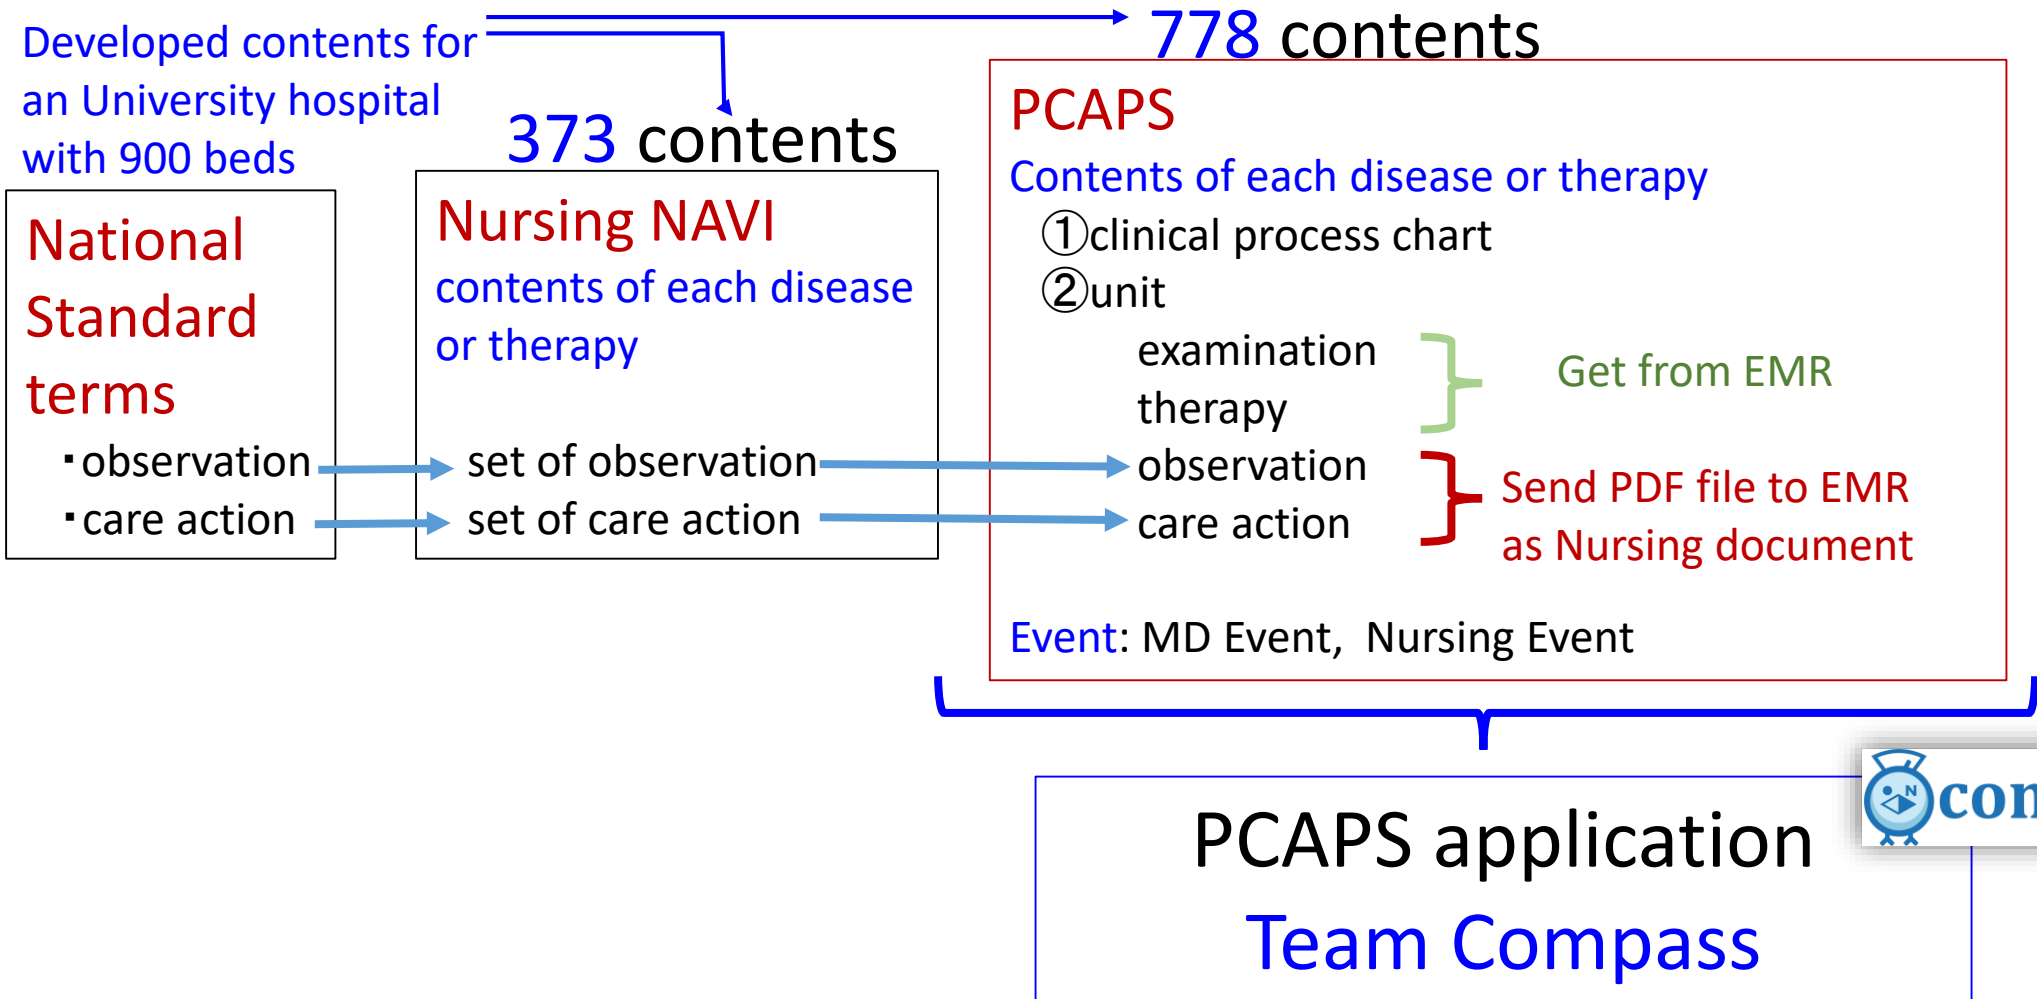

● **Blue: Nursing event**

**unique CPC**

COVID-19

# Step 2 : Development of digital path content

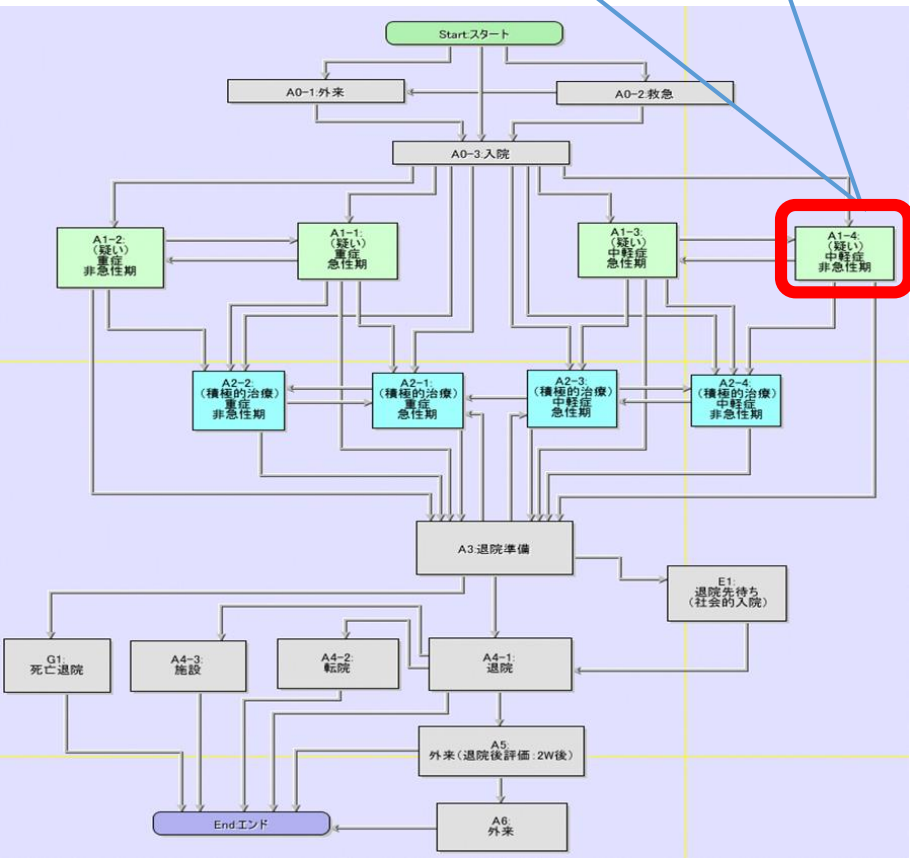

It was started to use the **Team Compass** connected EMR from May 2019 in Nara medical university hospital with 900 beds.

# Step 3 : Development of the application system and operation design

Medical doctor adopt each patient to best suited PCAPS content and ordered start unit.

Each unit has observation items designed by nursing experts and medical doctors. A nurse cannot delete the observation items ordered by medical doctors

List of PCAPS contents

# Step 4 : Implementation

In May 2019, a clinical support system linked to the EMRS was implemented in a 900-bed university hospital.

1. A medical doctor order PCAPS content for each patients from EMR
2. A nurse open EMR and select a patient.
3. When a nurse push 'compass button', PCAPS start for the patient.
4. A nurse grasp patient's conditions and start her work.

Compass Button

Terminal of EMR

A screenshot of the EMR system interface. The top bar shows 'PCAPS' and patient information: '00000005 模疑5 (男 5) 男 67才 テスト 医師'. The main area is divided into a left sidebar with 'ユニット履歴' (Unit History) and a central '臨床プロセスチャート' (Clinical Process Chart) with a red circle around a 'compass' button. To the right is a 'バイタルサイン' (Vital Signs) chart showing temperature and heart rate over time, with a table below it.

項目	0102	0103	0104	0105	0106	0107	0108	0109	0110	0111	0112	0113	0114	0115	0116	0117

## 2. Methods Development of a "COVID-19 clinical management system" (2020)

A COVID-19 clinical management system, consisting of PCAPS contents, monitoring tools, and an operational system, was developed.

### (1) PCAPS contents (COVID-19)

The Ministry of Health, Labor and Welfare (MHLW) created the "COVID-19 Clinical Practice Guide for New-type Coronavirus Infections, version 2.2. We developed a process path based on this guide, consisting of 4 units for suspected COVID-19 patients and 4 units for definitively diagnosed COVID-19 patients.

## 2. Methods Development of a "COVID-19 clinical management system" (2020)

(2) Monitoring tools (a COVID-19 symptom observation tool and a dashboard for all hospitalized patients)

The "COVID-19 Symptom Observation Enhancement Items" were developed. When they were applied to all inpatients, eight observation items were automatically incorporated into the nursing plan and implemented. A dashboard was developed to collect and monitor the entered data.

Management for parallel patient condition

**Event:** Event to inhibit medical treatment

- Red: Medical Doctor event
- Blue: Nursing event

**Nursing event:**  
intension items for symptoms of COVID-19 (8 items)

- Body temperature ( $\geq 37.5^{\circ}\text{C}$ )
- Cough
- Sputum
- feeling of fatigue
- nasal mucus
- Abnormity of taste
- Throat
- Difficulty of smell

The screenshot shows a clinical management system interface. At the top, there are tabs for 'プロセスチャート' (Process Chart), '医療業務' (Medical Business), and '経過表' (Progress Table). The main content area is divided into two sections. The left section, titled 'プロセスチャート', contains a list of nursing events for COVID-19 symptoms, each with a blue circular icon and a checkmark. The right section, titled '経過表', shows a flowchart with nodes labeled 'A0-6 SCU', 'A0-5', 'A1-2 (疑い) 非急性期', and 'A2-2 (積極)'. A red circle highlights the list of nursing events in the process chart section.

## 2. Methods Development of a "COVID-19 clinical managemen (3) Operational system

Using the monitoring tools described in (2), nurses in the infection control room narrowed down the list of suspected COVID-19 patients and wards where cluster outbreaks may have occurred and reported the results to a physician in the infection control department.

Based on this data, the physician decided whether to move patients to a different ward.

Then, the PCAPS content outlined in (1) was applied, and testing and treatment of suspected and definitively diagnosed COVID-19 patients were initiated. If a suspected COVID-19 patient was PCR-positive, they were transferred from the suspected ward to the COVID-19 ward.

Monitoring tool  
 (count of patient numbers every symptoms)

項目	入力数	陽性(症状あり)数
入院数 (分母)	783人	
入院数	1人(0.13%)	1人(0.13%)
最高体温(>=37.5)	Body temperature (>=37.5°C) 617人(78.8%)	62人(7.92%)
咳嗽	Cough 577人(73.69%)	82人(10.47%)
喀痰	Sputum 581人(74.2%)	63人(8.05%)
倦怠感	feeling of fatigue 582人(74.33%)	70人(8.94%)

## 2. Methods Development of a "COVID-19 clinical management system" (2020)

### (3) Operational system

All nursing plans for both wards were standardized based on the PCAPS content (COVID-19). The nurses assigned to both wards rotated at regular intervals, but this did not cause any confusion. As the number of infected patients changed, the numbers of beds allocated to the suspected COVID-19 and COVID-19 wards were also altered, resulting in the repeated reorganization of general wards and the reassignment of nurses.

In hospitals that implemented this system, when nurses were assigned to other wards they were immediately able to provide appropriate clinical care based on each patient's nursing care plan.

## 5. Conclusion

- The effectiveness of the implementation of the developed systems was analyzed using the nurse turnover rate. We collected and compared relevant data from three hospitals. The results suggest that these systems have the potential to reduce nurse turnover in addition to the previously reported ability of Team Compass with PCAPS to reduce overtime hours.
- In Japan, there is a need to respond to future pandemics and to reform the work styles of physicians and nurses. The abovementioned systematic approach has great potential to contribute to both of these aims.
