

### **Understanding trans health**

Dr Sally Murray Sexual Health Physician

Sally.Murray@health.wa.gov.au

### Michelle

23 yo birth assigned female

Comes in requesting testosterone, 'I want to be a man'.

Lives at home

Studies mathematics at Uni

What do you do? What issues will Michelle face? What resources are available to support her?

### **Common issue #1: What is gender?**

### **Common issue #2: Discrimination & stigma**

Western Australian Lesbian, Gay, Bisexual, Transgender, Intersex

Health Strategy 2019–2024

Diverse communities, diverse care

Other key barriers experienced by LGBTI populations to accessing health services include:<sup>2,9,10</sup>

- discrimination and/or exclusion
- previous negative experiences in a health service
- minority stress<sup>9</sup>
- internalised homophobia<sup>9</sup>
- reduced awareness and knowledge among health professionals and support staff
- limited health literacy.<sup>10</sup>

# Myth busting: society and gender

- Pink clothes are feminine...
- Men wear trousers...
- Trans started with social media...
- Third genders are academic only...

As a 1918 article in the magazine *Earnshaw's Infant's Department* states, "the generally accepted rule is pink for the boys, and blue for the girls. The reason is that pink, being a more decided and stronger color, is more suitable for the boy, while blue, which is more delicate and dainty, is prettier for the girl." I was taken aback. That's

### Trans\* started with social media

### Remember non-binary, gender nonconforming, queer, gender fluid...

- There are a lot of terms that refer to individuals whose gender expression does not conform to conventional expectations of masculinity and femininity.
- Some identify as transgender, others do not.
- Remember the continuum

# **TRANS\***

I recently adopted the term "trans\*" (with the asterisk) in my writing. I think you should, too. If it's new to you, let me help clarify. Trans\* is one word for a variety of identities that are incredibly diverse, but share one simple, common denominator: a trans\* person is not your traditional cisgender wo/man. Beyond that, there is a lot of variation.

### WHAT DOES THE \* STAND FOR?

### **\*TRANSGENDER \*TRANSSEXUAL \*TRANSVESTITE** \*GENDEROUEER \*GENDERFLUID \*NON-BINARY \*GENDERF\*CK \*GENDERLESS **\*AGENDER \*NON-GENDERED \*THIRD GENDER \*TWO-SPIRIT \* BIGENDER** \*TRANS MAN **\*TRANS WOMAN**

### **Common issue #3: Mental health**

### TRANS PATHWAYS SUMMARY

### Mental health issues

- 4 out of 5 trans young people have ever self-harmed (79.7%)
  - This is compared to 10.9% of adolescents (12-17 years) in the Australian general population
- Almost 1 in 2 trans young people have ever attempted suicide (48.1%)
  - This is 20 times higher than adolescents (12-17 years) in the Australian general population
  - This is 14.6 times higher than adults (aged 16-85 years) in the Australian general population

# TRANS PATHWAYS SUMMARY

### Risks for poor mental health

- 89% had experienced peer rejection and 74% had experienced bullying
- 78.9% had experienced issues with school, university or TAFE
- 68.9% had experienced discrimination
- 65.8% had experienced lack of family support
- 22<sup>%</sup> had experienced accommodation issues or homelessness.

Experiences with medical and mental health services

- 60.1% have experienced feeling isolated from medical and mental health services
- 42.1% of participants have reached out to a service provider who did not understand, respect or have previous experience with gender diverse people

Problems included:

- Lack of knowledge on trans issues
- Not knowing how to help the trans young person or where to refer them
- Transphobia
- Telling the young person they were going through a phase
- Being forced to repeat their story every time they saw a new clinician
- Services that are trans-friendly are at capacity, have long waiting lists, and may be costly because they are private.

# Common issue #4: Teaching the medical profession

- Different patient, different goals . . .
- Depends on the age of the patient
- Gender dysphoria assessment & psych support
- Medical assessment
- Hormone blocking treatment
- Cross-hormone therapy
- Other support eg gender marker letters
  - Binding, prostheses
  - Voice therapy
  - Hair removal

- 2 University of Texas at Austin, Austin, Texas.
- 3 University of British Columbia, Vancouver, British Columbia, Canada.
- 4 New York University, New York, New York.

#### Abstract

**PURPOSE:** This study aimed to examine the relation between chosen name use, as a proxy for youths' gender affirmation in various contexts, and mental health among transgender youth.

**METHODS:** Data come from a community cohort sample of 129 transgender and gender nonconforming youth from three U.S. cities. We assessed chosen name use across multiple contexts and examined its association with depression, suicidal ideation, and suicidal behavior.

**RESULTS:** After adjusting for personal characteristics and social support, chosen name use in more contexts was associated with lower depression, suicidal ideation, and suicidal behavior. Depression, suicidal ideation, and suicidal behavior were lowest when chosen names could be used in all four contexts.

**CONCLUSION:** For transgender youth who choose a name different from the one given at birth, use of their chosen name in multiple contexts affirms their gender identity and reduces mental health risks known to be high in this group.

#### Author information

1 Toronto, Ontario, Canada From the Division of Plastic and Reconstructive Surgery, Department of Surgery and Surgical Oncology, University Health Network; the Division of Plastic and Reconstructive Surgery, Faculty of Medicine, and the Lawrence S. Bloomberg Faculty of Nursing, University of Toronto; and the Division of Plastic and Reconstructive Surgery, Women's College Hospital.

#### Abstract

**BACKGROUND:** The relationship between satisfaction with information and decision regret has not been previously studied in breast reconstruction patients. The objective of this study, therefore, was to assess this relationship and the factors that may influence satisfaction with preoperative information, including self-efficacy (confidence with seeking medical knowledge).

**METHODS:** All patients who underwent breast reconstruction between January of 2009 and March of 2011 were approached to complete the Modified Stanford Self-Efficacy Scale (1 to 10), the satisfaction with information subscale of the BREAST-Q (1 to 100), and the Decision Regret Scale (1 to 100). Two multinomial logistic regression models were built to assess the relationship between patient-reported satisfaction with information and decision regret, and to evaluate the relationship among satisfaction with information. self-

onouoy lovol, and ocologionographic ondractonotico.

**RESULTS**: In 100 participants (71 percent response rate), the mean Decision Regret Scale score was  $9.3\pm17.3$  of 100, and the majority of patients experienced no regret (60 percent). We found that regret was significantly reduced when patients were more satisfied with the preoperative information that they received from their plastic surgeons ( $\beta$ =0.95; 95 percent CI, 0.93 to 0.96). Furthermore, patients reported higher satisfaction with information when they possessed more self-efficacy irrespective of their sociodemographic characteristics ( $\beta$ =1.06; 95 percent CI, 1.04 to 1.09).

that they receive in the preoperative period, and ultimately suffered more regret over their decision to undergo breast reconstruction.

### Regret

In examining the 73 studies, the average prevalence of patient regret was 14.4%, yet ranged widely depending on the study. For example, Hellgren and Stahle [12] reported that patients undergoing heart valve surgery with prolonged postoperative ICU care expressed no regret related to their hospital course. In contrast, up to 57% of patients undergoing radical prostatectomy for prostate cancer experienced regret [13]. Interestingly, the prevalence of regret was generally higher among oncology patients (18.1%) compared with patients who underwent surgery for a non-oncology/benign indication (10.0%). Variation in
