**Collaboration vs control – information management for IT people**

Information is a university's core business. Collaboration and knowledge innovation is crucial to our success, but as a Public Authority, the way we manage information is bound by legislative requirements.

In this workshop, we will explore a risk-based approach to information management that can enable your organisation to create, collaborate, and share, without compromising on governance.

Workshop participants will analyse real-life case studies and produce an information risk profile according to the 5 purposes of information management: discovery, sharing, collaboration, security & preservation. Based upon this risk profile, we will determine *where* these assets could be stored and *how* they should be managed.
