

Shifting to Cloud-managed Networking to deliver such services as AV over IP for modern learning outcomes

Julian Critchlow, General Manager, Extreme Networks, Australia and New Zealand

New high bandwidth applications such as AV and increased security challenges have forced many higher education institutions to look at their traditional network architectures. Hear how these shifts require a new approach to network infrastructure, design and deployment. From the devices educators and students use, to the applications that enable digital experiences, and the software that connects the learning community, new challenges require new technology to meet them. Understand the tools available to establish a robust, automated, secure network that can accommodate a diverse range of traffic and applications on your university's network.
