

Comprehensive care coordination for human services and post-acute

CareManager

Netsmart population health management solutions let you aggregate clinical, financial and operational data, giving organizations near real-time insights on value-based contracts that can be reported back to payers or other partners. It's the most powerful, comprehensive set of population health management tools available to post-acute organizations.

Interoperability functionality connects your organization with all providers, including primary and acute care, to create a complete, longitudinal record of each individual. Analytic and reporting tools systematically aggregate data to segment risks in populations and stratify by risk levels, allowing timely interventions.

Ready access to population health management analytics also allows your staff to flag and develop more efficient protocols for specific conditions. Many care management tasks are automated, removing potential human errors and providing greater efficiency, as well as an exceptional user experience.

CareManager is an EHR-agnostic solution that coordinates care across all settings

Key features

- Displays and aggregates meaningful data in one system
- Access to performance measures and data in real-time, saving time and improving outcomes
- Presents the whole picture of an individual with metrics that matter

Key benefits

- Easily assign and manage caseloads
- Integration with multiple disparate systems to eliminate double entry of clinical data
- Real-time reporting accessible to all users
- Access to a person's complete health history
- Actionable analytics for proactive care
- Configurability to automate workflows
- Improve outcomes by proactively identifying and managing gaps in care
- Supervisor dashboard
- Automation of case load assignment and tasks
