

Image, Football and Urban Development

59th ERSA Congress 2019, 29th August 2019, Lyon

Steffen Büssers, Christina Fischer, Matthias Freund, Rüdiger Hamm

**NIERS – Niederrhein Institute for Regional and Structural Research
Hochschule Niederrhein, University of Applied Sciences**

Outline of Presentation

1. Introduction
2. Theoretical considerations
 - a. Image and regional development
 - b. City image and its determinants
3. Hypothesis, research design and data
4. Empirical results
5. Conclusion

Introduction

Previous results

- Recent paper (Fischer and Hamm 2019) analyses relationship between city image and the image of its football club
- Main results:
 - Borussia Mönchengladbach is the city's most important image builder
 - Positive correlation between the image of a football club and the city image
 - Close relationship between the club's and the city's image
 - Transfer of the club's image to the city

Research question

- **Is it possible to identify city image as a relevant determinant of urban economic development?**

Theoretical considerations – Image and regional development

City image and urban development

- City image is relevant for the location decisions of key target groups like (Kotler et al. 1994; Riebel 1993):
 - Firms
 - Residents
 - Workers
 - Tourists
- The result of the location decisions of these key target groups determine economic development and economic success of cities (Florida 2002)

Theoretical considerations – Image and regional development

The decisions influence regional development:

Increase regional job offers, employment, income, and tax receipts (Krenz 2016)

Increase the number of inhabitants, the supply of (qualified) workers and the amount of tax receipts (Jensen-Butler 1999)

Stimulate regional economic development (Goeldner and Ritchie 2009)

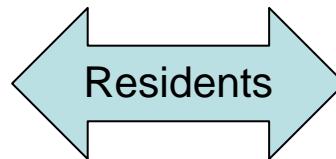

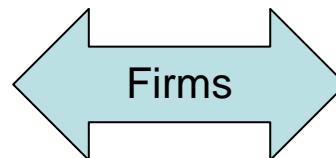

Image is expected to be ...

... a relevant 'soft' factor for the locational choice of companies (e.g. Eickelpasch et al. 2016; Grabow et al. 1995)

... a relevant determinant for residential choice (Rosenfeld 2012). It is more difficult for a city with a negative image to attract skilled inhabitants (Kubo et al. 2012; Scholz 1989)

... a crucial factor for visitors' destination choices (e.g. Agapito et al. 2013; Crompton 1979)

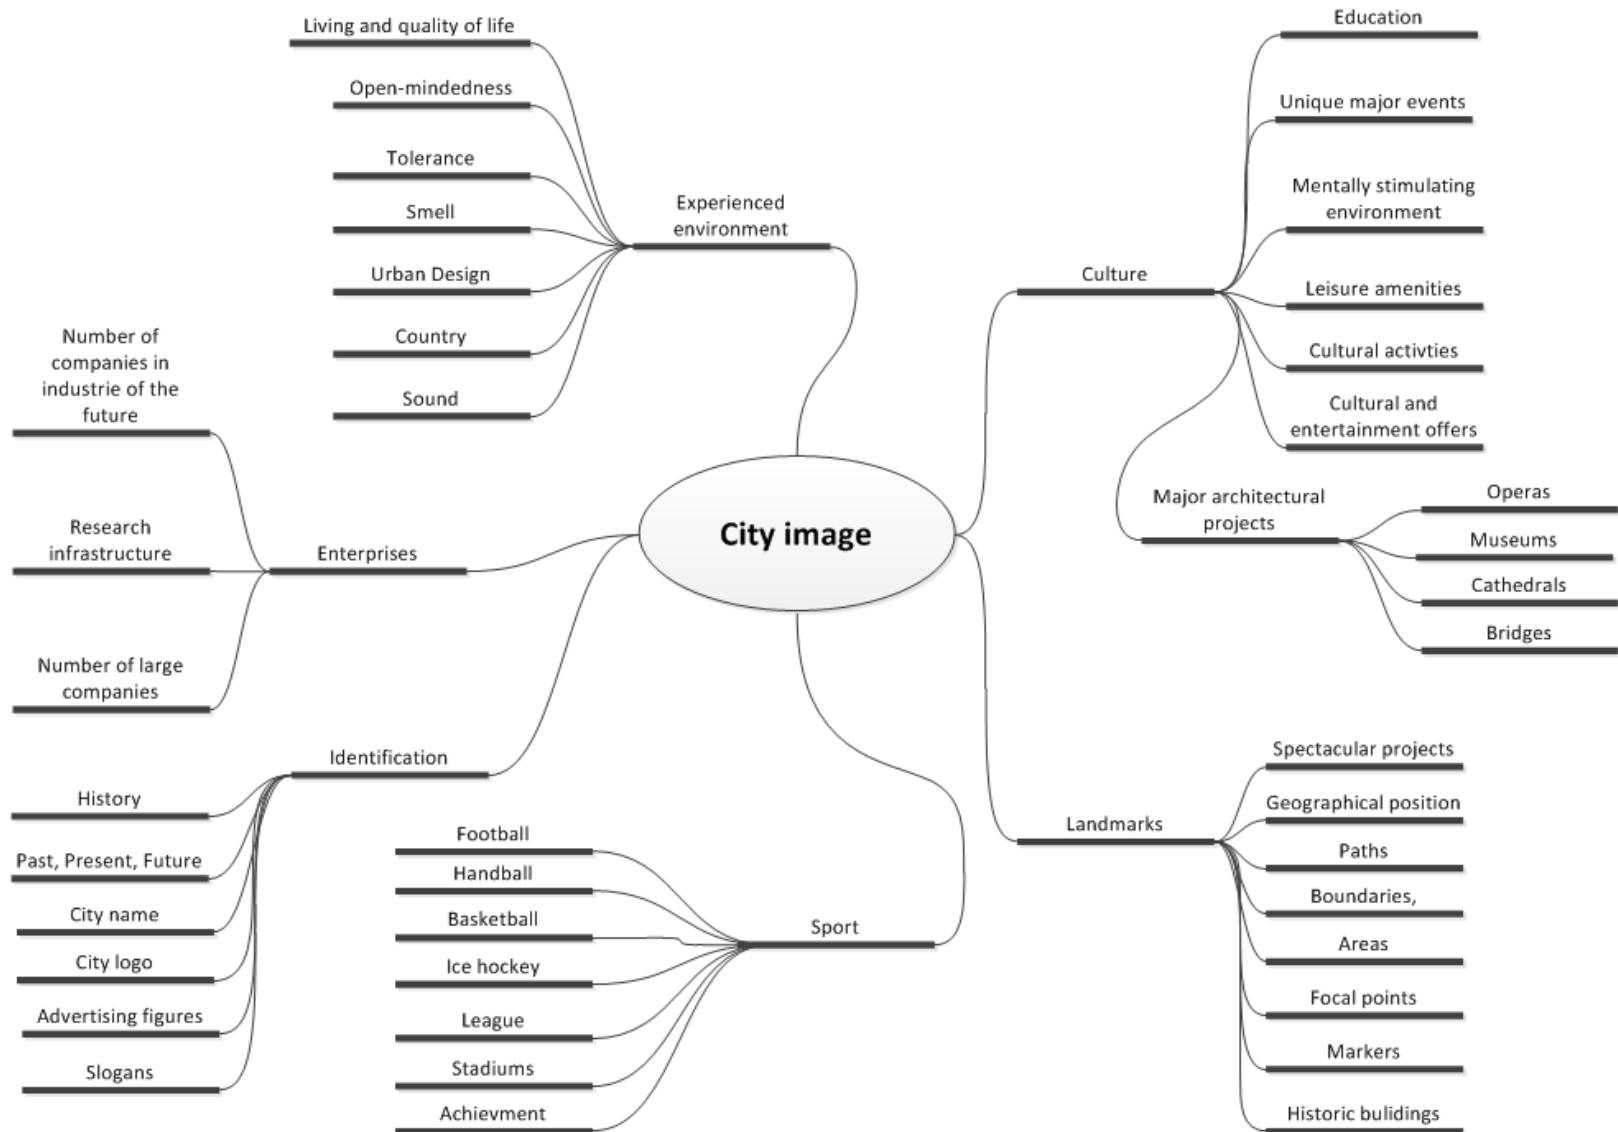

- There is a positive relationship between urban image and regional development

Theoretical considerations – City image and its determinants

City image

- Brand image is ‘the set of beliefs, ideas, and impressions a person holds regarding an object’ (Kotler and Keller 2012, p. G4)
- City image is defined as ‘the sum of beliefs, ideas, and impressions that a person has of a destination’ (Crompton 1979, p. 18)
- A multitude of determinants shape the image of cities, regions and countries: (Beerli and Martin 2004)
 - Natural resources
 - Natural environment
 - Infrastructure
 - Culture, history and art
 - Leisure and recreation
 - Social environment
 - Political and economic factors
 - Atmosphere of the place

Theoretical considerations – City image and its determinants

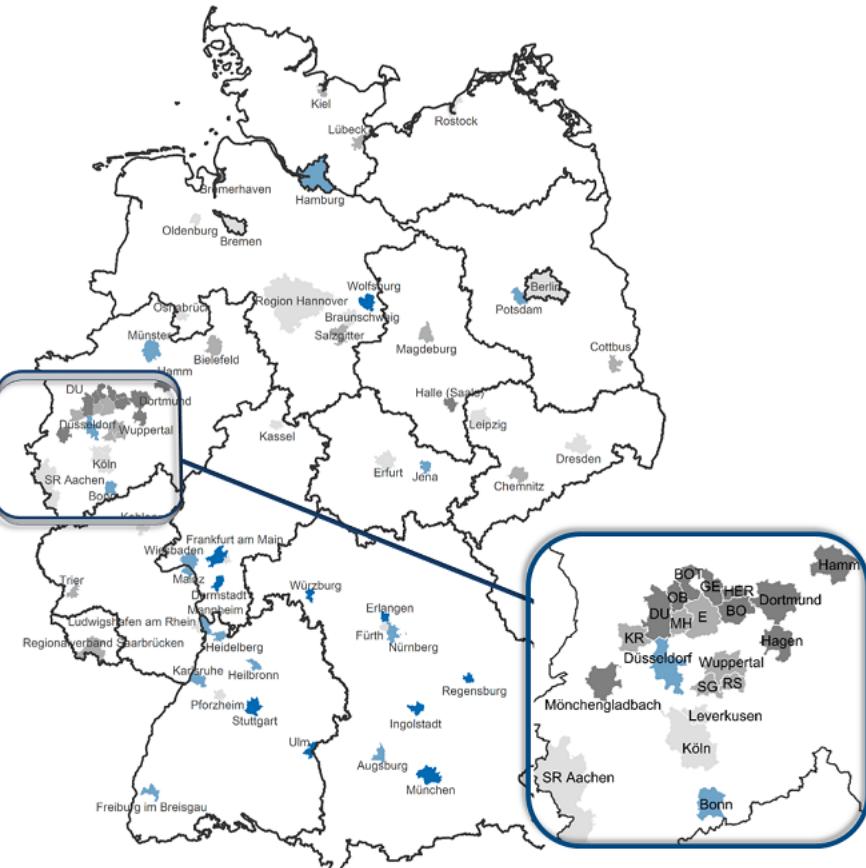

Hypothesis, research design and data

Hypothesis

- Urban (regional) development depends on urban (regional) image

Research design

- 71 German cities with more than 100.000 inhabitants
- Four years of observations: 2013 - 2016
- Data sources
 - Statistisches Bundesamt
 - Bertelsmann Stiftung
 - Kicker
 - Börse.de Finanzportal AG
 - Deutscher Bühnenverein
 - Institut der deutschen Wirtschaft Köln Consult GmbH

Hypothesis, research design and data

Production function

- The estimation is based on a regional production function
- Output of a city (Y) is explained by urban factor inputs of labor (L) and capital (C)
- Additionally, different image-variables (I) were tested

$$Y = f(L, C, I)$$

Variable	Content	Data on urban level
Y	Output	Gross domestic product, GDP
L	Labor	Employees
HQ	Highly qualified	Employees with academic degree
NQ	Normal qualified	Employees with no academic degree
C	Capital	Gross fixed assets
I	Image	Different definitions

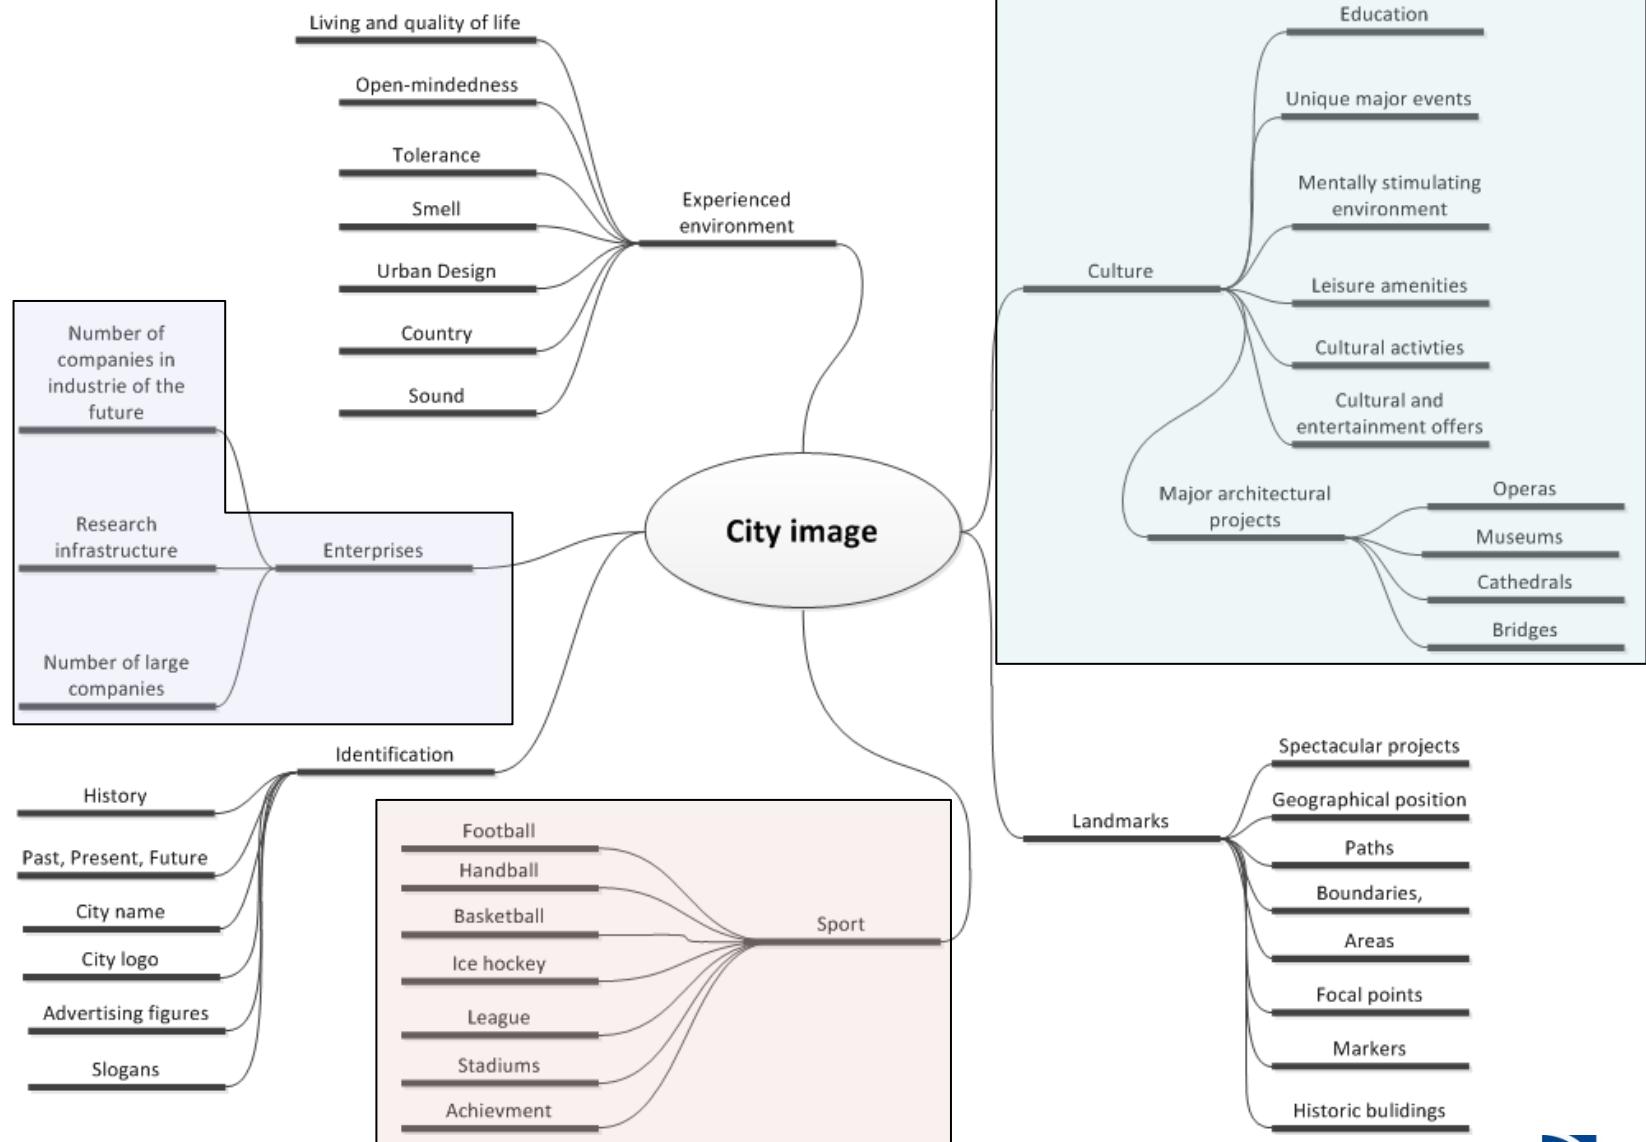

Quelle: eigene Darstellung

- Thus, the estimation function is as follows:

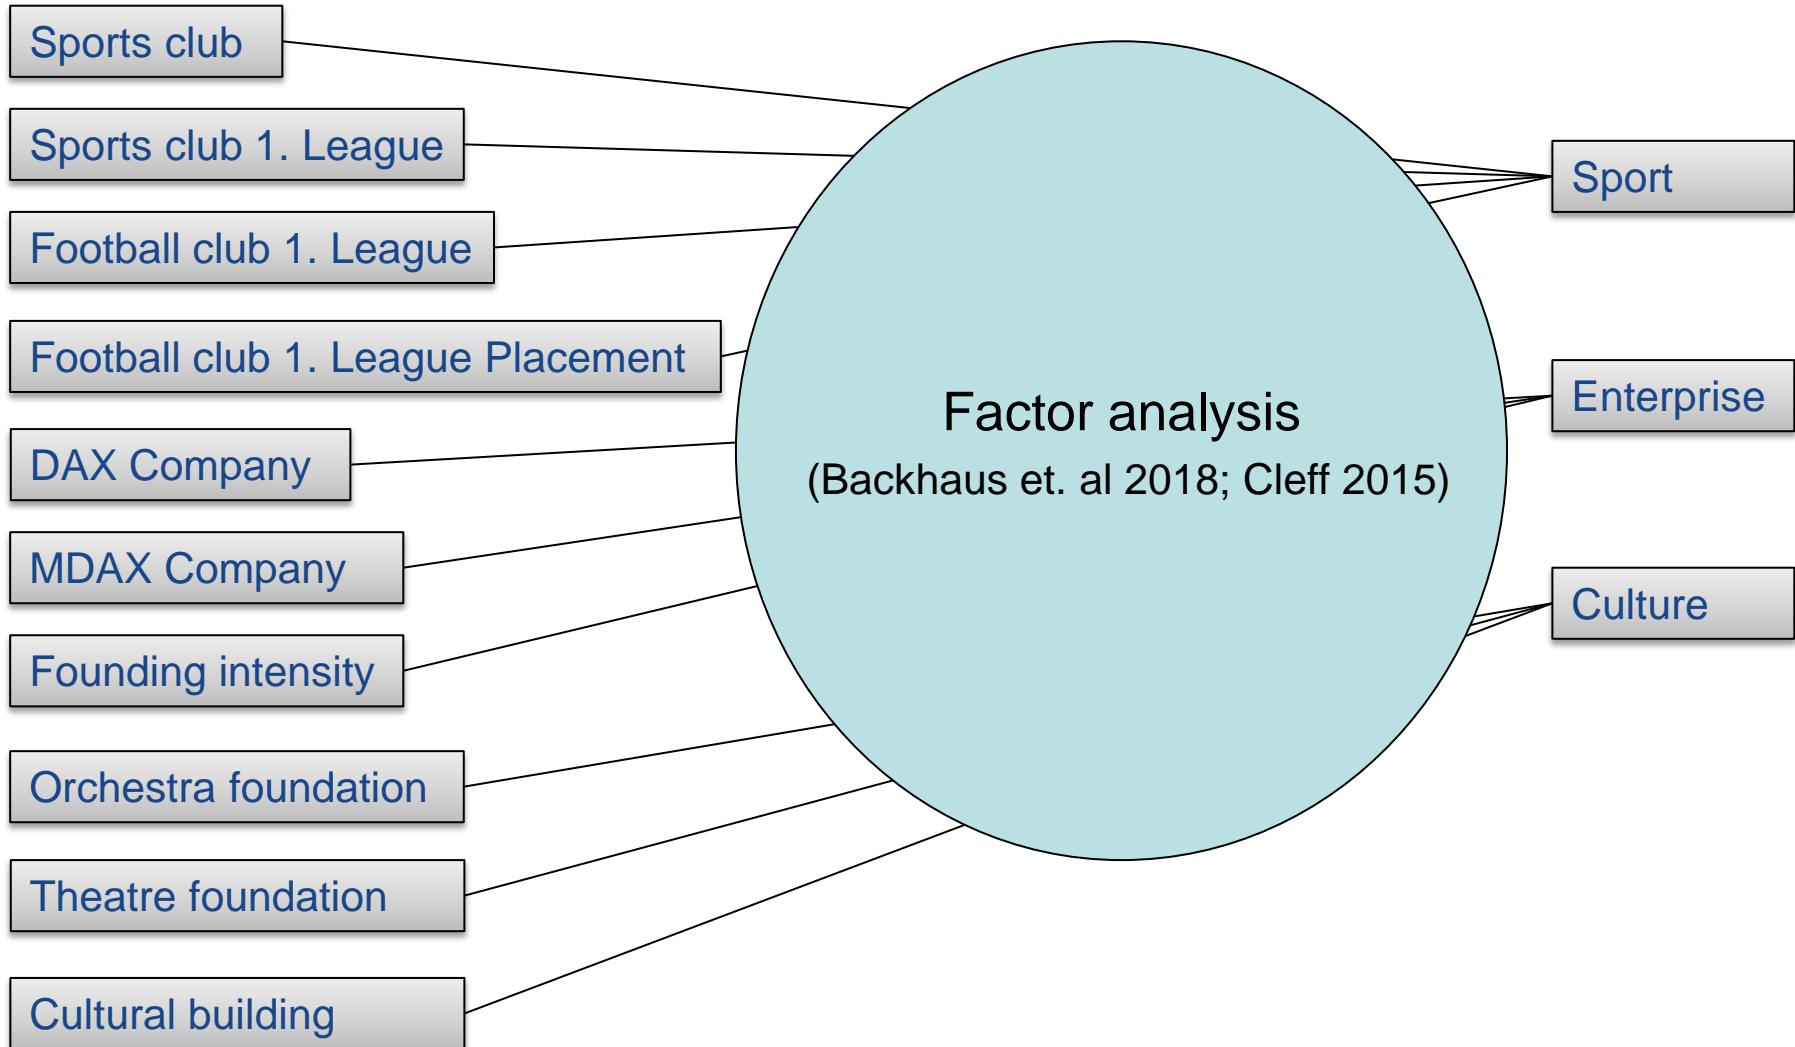

$$\ln Y = \gamma + \alpha \ln L + \beta \ln C + \delta I + \varepsilon$$

- Pooled OLS ($n = 71$ cities for $t =$ four years) (Cameron and Trivedi 2005)
- OLS ($n = 71$ cities for $t =$ one year) (Kohler and Kreuter 2016)

Hypothesis, research design and data

Hypothesis, research design and methods

Hypothesis, research design and data

OLS-Models

- Model 1 $\rightarrow Y = f(L, C) \rightarrow \ln Y = \gamma + \alpha \ln L + \beta \ln C + \varepsilon$
- Model 2 $\rightarrow Y = f(HQ, NQ, C) \rightarrow \ln Y = \gamma + \alpha_1 \ln HQ + \alpha_2 \ln NQ + \beta \ln C + \varepsilon$
- Model 3 $\rightarrow Y = f(HQ, NQ, C, I_{Sport}, I_{Enterprise}, I_{Culture}) \rightarrow$
 $\ln Y = \gamma + \alpha_1 \ln HQ + \alpha_2 \ln NQ + \beta \ln C + I_{Sport} + I_{Enterprise} + I_{Culture} + \varepsilon$
- Model 4 $\rightarrow Y = f(HQ, NQ, C, I_{Sport}, I_{Enterprise}) \rightarrow$
 $\ln Y = \gamma + \alpha_1 \ln HQ + \alpha_2 \ln NQ + \beta \ln C + I_{Sport} + I_{Enterprise} + \varepsilon$
- To avoid possible endogeneity (Stoetzer 2017) or multicollinearity (Schneider 2009)
- Model 5 $\rightarrow Y = f(H, C, I_{(Sport+Enterprise)/2}) \rightarrow$
 $\ln Y = \gamma + \alpha_1 \ln HQ + \alpha_2 \ln NQ + \beta \ln C + I_{(Sport+Enterprise)/2} + \varepsilon$

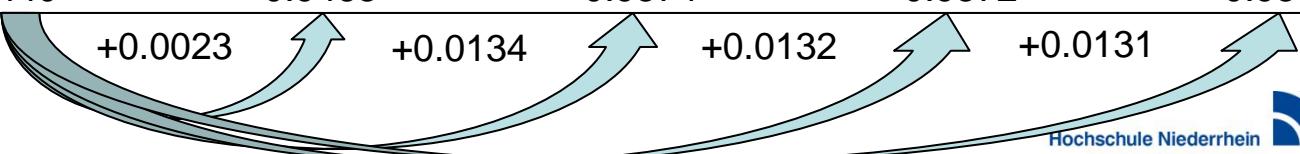

Y	Output	Gross domestic product, GDP
L	Labor	Employees
HQ	Highly qualified	Employees with academic degree
NQ	Normal qualified	Employees with no academic degree
C	Capital	Gross fixed assets
I	Image	Different definitions

Conclusion

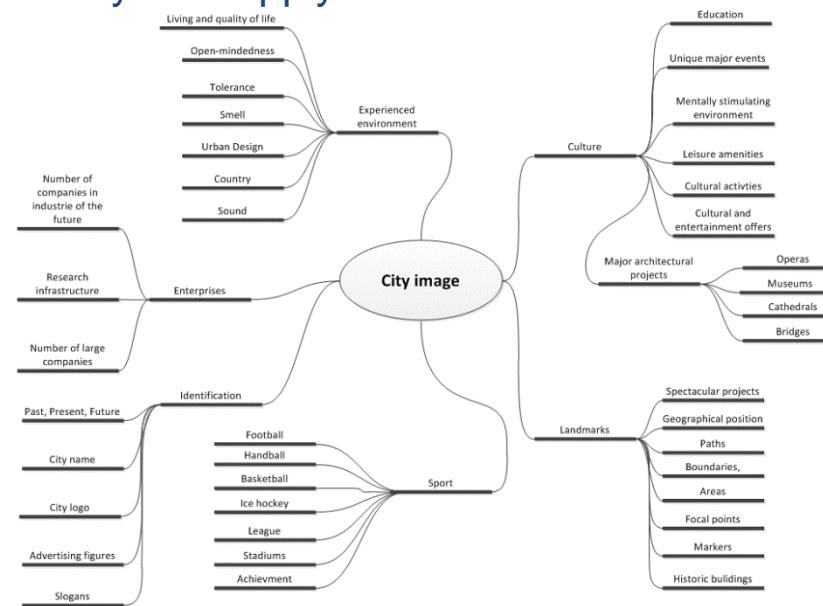

Results

- The hypothesis that the “sports” and “enterprises” (as possible image components) influence a city’s economic performance can be confirmed
- The hypothesis that “culture” (as possible image component) influences a city’s and its economic performance can not be confirmed
- These results hold for the pooled regression as well as single years with very similar results

Conclusion

Study is still a work in progress

- Can further factors for the image of a city be formed, which have significant effects on the economic performance of a city?
 - Are there better variables for the culture factor?
 - Can the other main points be represented by variables?
 - Can other sports also be identified?
- Do the results for Germany also apply to other countries?
