**Minimum Intervention Oral Care - Preventing Dentistry "MI" Way!**

A. Banerjee

King's College, London, United Kingdom

In his presentation, Prof Banerjee from King's College London, will outline the contemporary person-focused, prevention-based, team-delivered and susceptibility/needs-related minimum intervention oral care framework. This can be used to deliver better oral health to patients and populations, across all disciplines of Restorative Dentistry, including caries management. He will focus on outlining the preventive approaches to managing early demineralisation to reverse tissue damage caused by biofilm-mediated conditions. He will highlight scientific and clinical evidence base for primary and secondary prevention, including remineralisation.
