# Introduction, background and purpose: admin-based SSAI

We are presenting our efforts to **replace** the traditional fully survey-based **statistics** Service Sector Activity Indicators (SSAI), with a combination of **survey and administrative data** from the Spanish National Tax Agency.

Our access to survey and administrative data from 2019 to the present has allowed us to conduct comparisons not only at the aggregate level but also at the **microdata** level.

# Data description

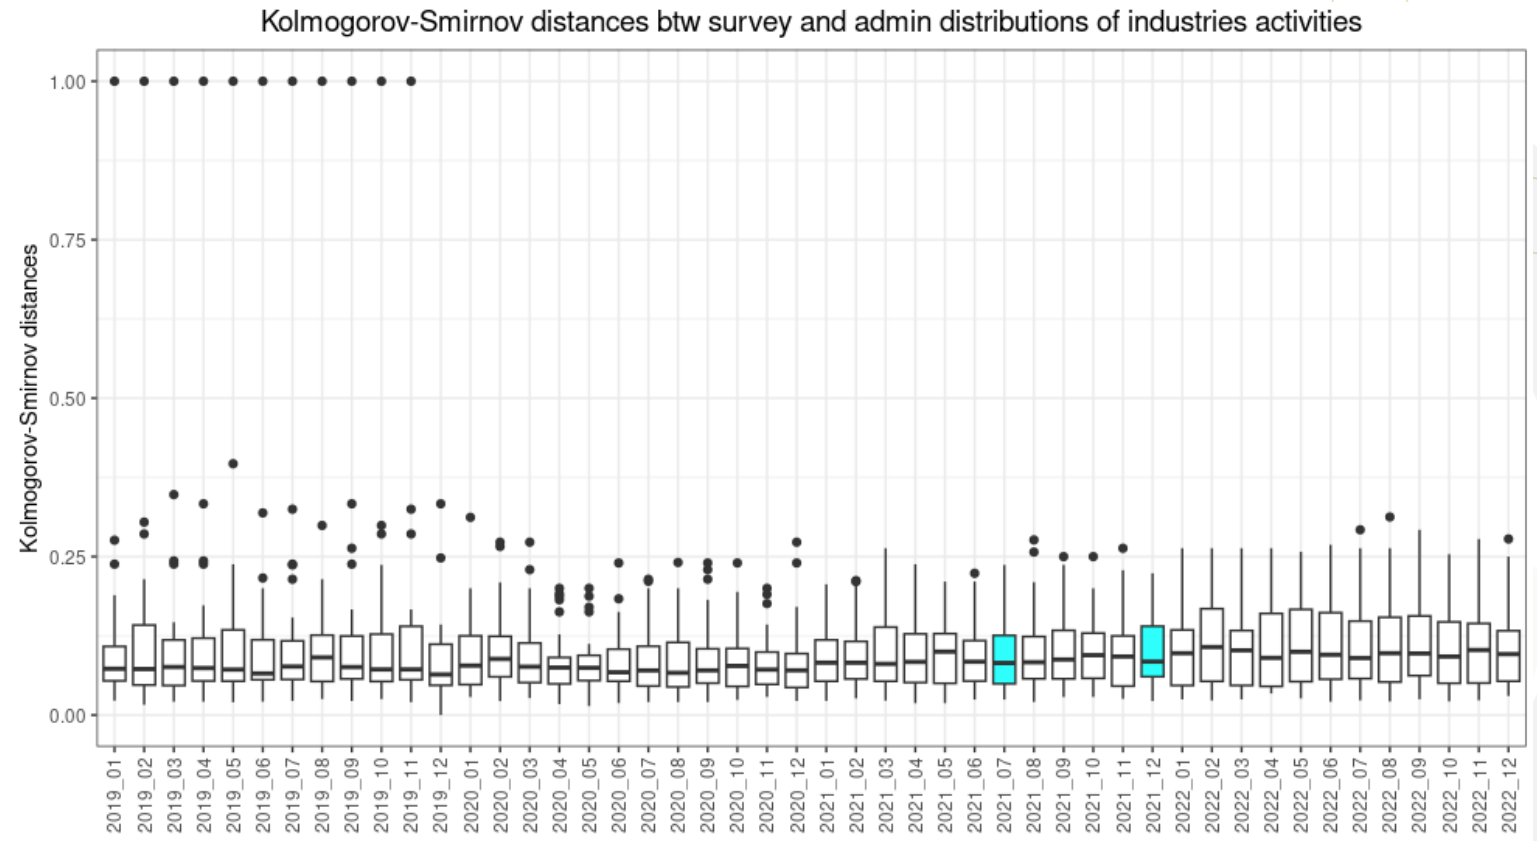

- $U$  the **finite population** of analysis.
- $U_F \subset SBR$  the **frame population** from the Statistical Business Register (SBR).
- $U^{adm}$  the set of business units contained in the **tax register**.
- $U^{mdl} = U^{adm} \cap U_F$  the set of **statistical units** in the **tax register**.
- $S^{mdl} = S \cap U^{mdl}$  the set of statistical units in the training data set.
- $y$  is the statistical variable of interest (**turnover** in this use case).
- $y^{stat}$  denotes the values obtained with the **survey**.
- $y^{adm}$  denotes the values obtained with the **administrative register**.

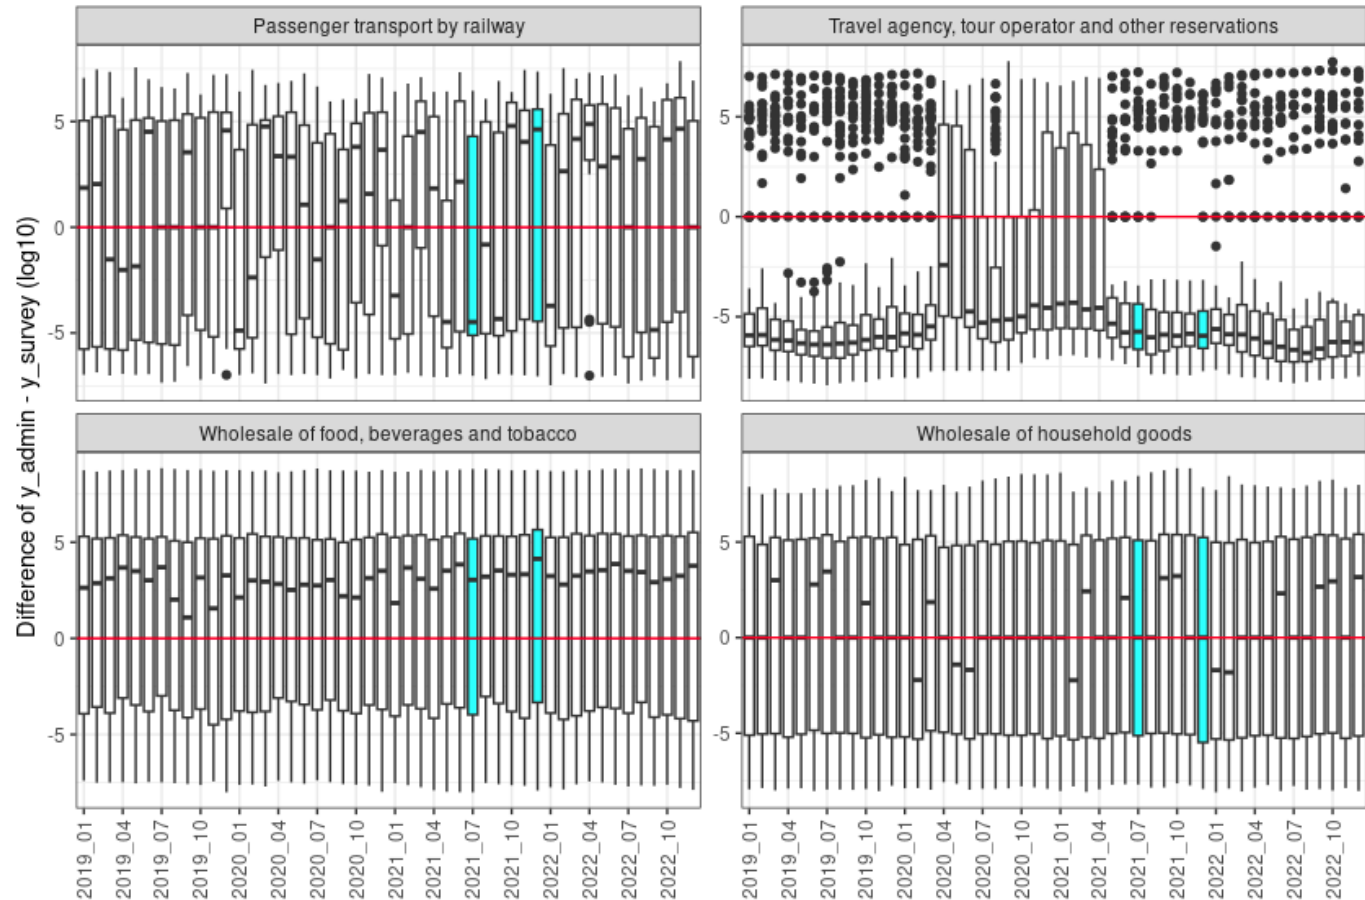

# Data comparison for unit- level microdata: Kolmogorov - Smirnov distance

# Data comparison for unit- level microdata: turnover differences by industrial activity

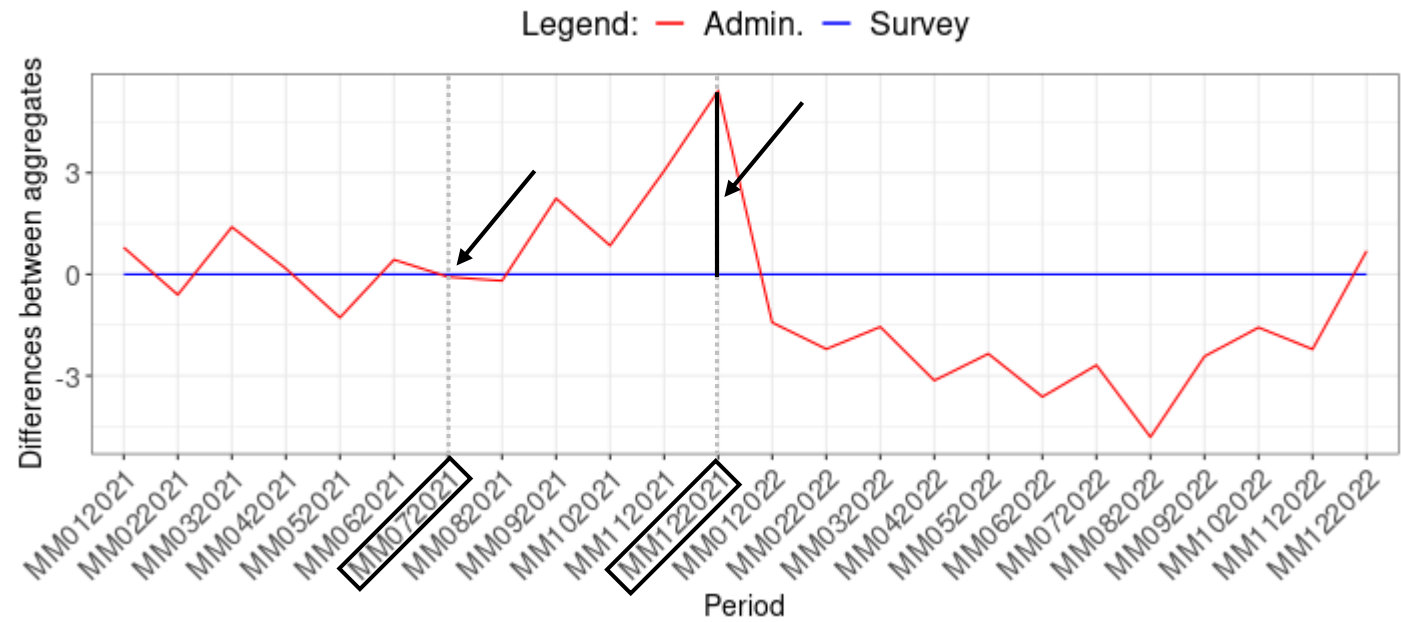

Distribution of admin-survey turnover difference by industry activity

# Data comparison for aggregated- level macrodata: turnover differences

Comparison at macro level for turnover indexes

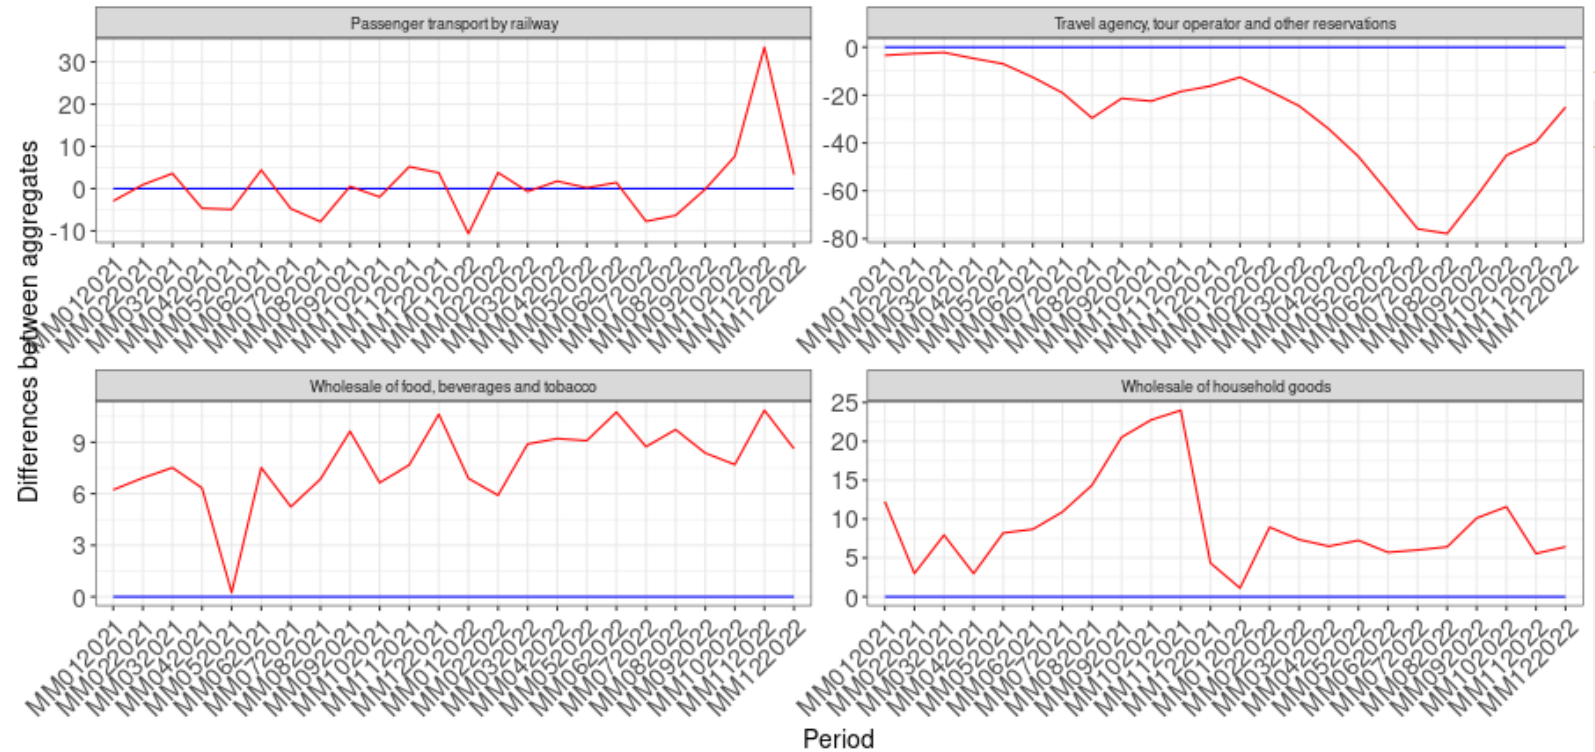

### Comparison at macro level for turnover indexes by industrial activity

Legend: — Admin. — Survey

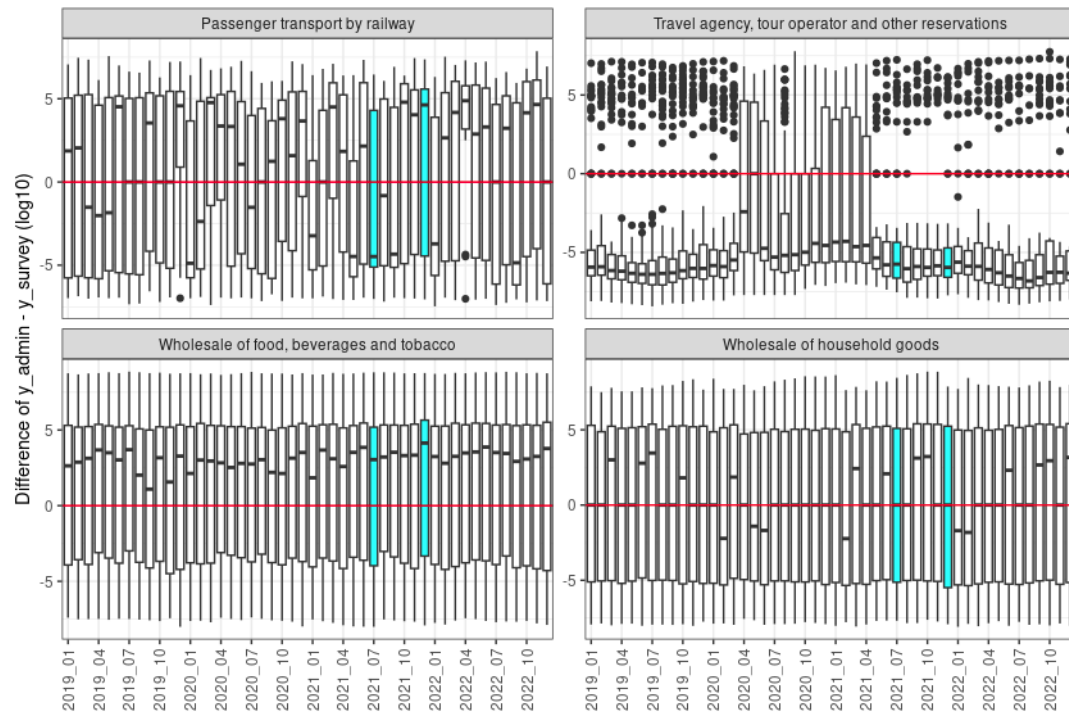

Data  
comparison  
for  
aggregated-  
level  
macrodata  
by industrial  
activity

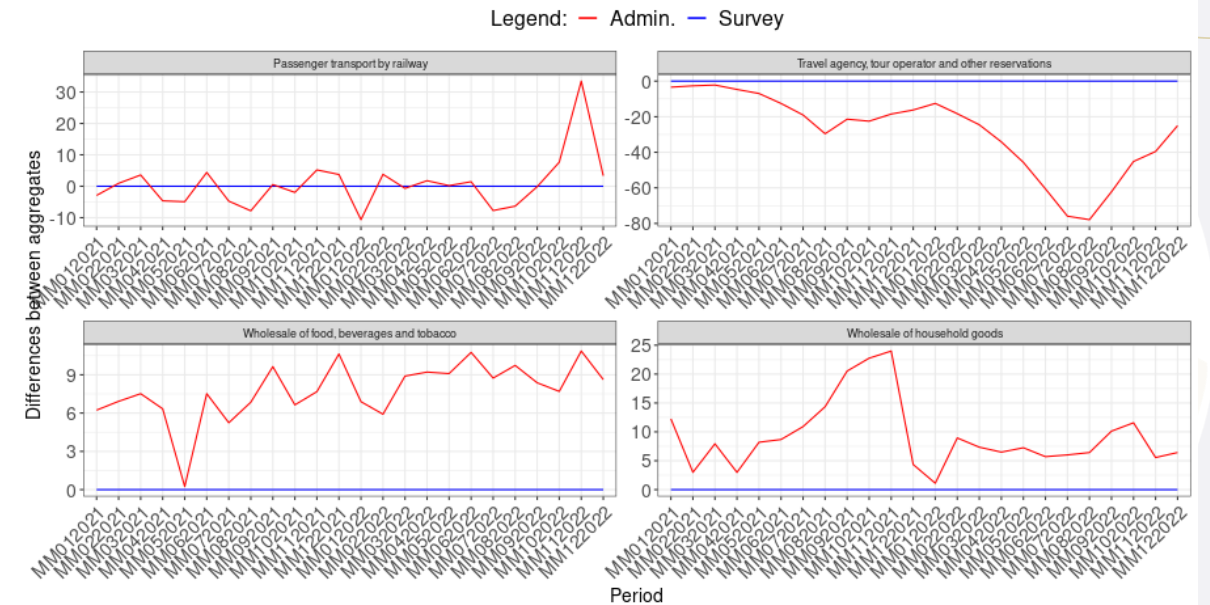

Behaviour of the **microdata** by activity sector diverges significantly from that of the corresponding **aggregates**!

Distribution of admin-survey turnover difference by industry activity

Comparison at macro level for turnover indexes by industrial activity

Can we  
anticipate  
the  
performance  
of a data  
source with  
input quality  
indicators?

Examining July and December 2021 in particular...

### Comparison at macro level for turnover indexes

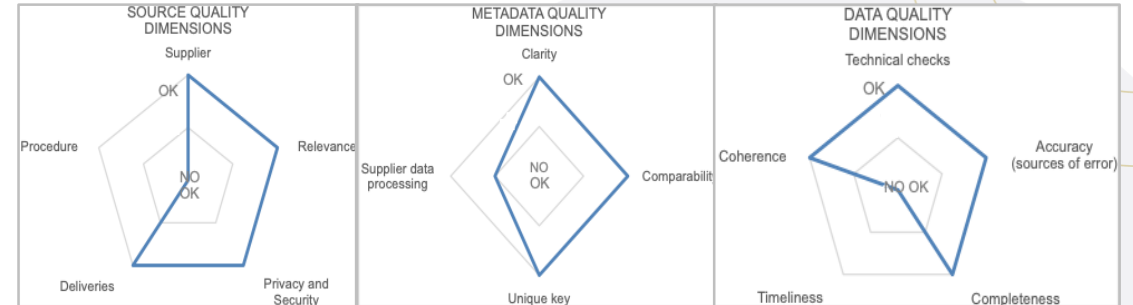

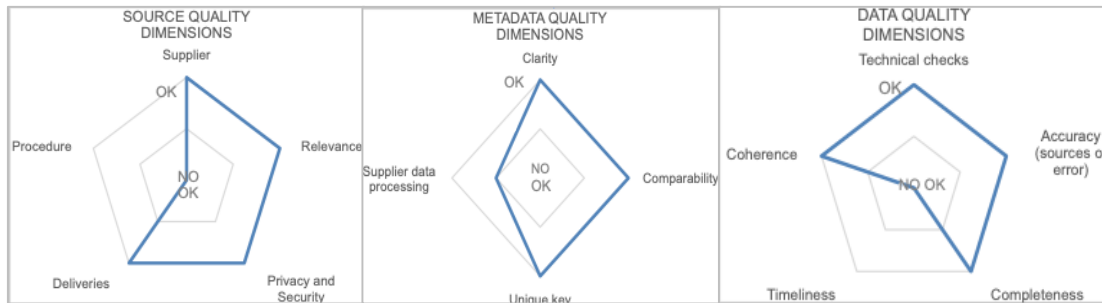

Legend: — Admin. — Survey

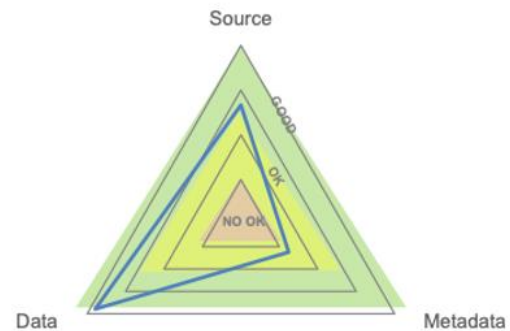

## July 2021

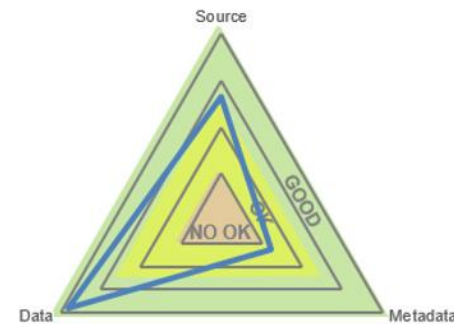

## December 2021

### QUALITY OF THE ADMIN REGISTER FOR MM072021

### QUALITY OF THE ADMIN REGISTER FOR MM122021

**Essentially  
indistinguishable  
despite the  
dissimilarities in  
the aggregated  
data!**

## Overall conclusions

- The differences observed in the exploration of the input quality **cautiously discourage** the use of the administrative values by mere substitution as the statistical values.
- The **generation process** significantly influences the **quality** of the final results (aggregates). Conversely, the quality of the input (microdata) is determined by both the intended use of the output (aggregates) and the chosen input processing methods.
- There **remains** a significant amount of **work to be done** in order to develop a fast, accurate, efficient, and appropriate method for measuring the quality of administrative data as an input.
