

## **Lithium and the Energy Transition**

*Lucy Crane, ESG & Sustainability Manager, Cornish Lithium*

Cornish Lithium is an innovative mineral exploration and development company, focussed on the environmentally and socially responsible extraction of lithium in Cornwall. The Company is progressing towards extraction of lithium from two previously considered 'unconventional' sources of lithium: from geothermal waters, and from mica minerals disseminated through granite rock. Through embracing new technologies to explore for and extract the lithium, LCAs to evaluate their projects and building in circular economy design principles to use the resources as efficiently as possible (including partnering with potential heat users at geothermal lithium sites), Cornish Lithium aims to be a global leader in responsible mineral production.
