- **Supraglacial lake extent** were delineated to classify water within S2 images.
- **Lake depths** were calculated using a radiative transfer model.
- **Total lake volume** was calculated by multiplying lake depths by lake area for each individual lake polygon and summing over the basin area. Volume uncertainty was determined via comparison with ICESat-2 transects.

WHAT

SUP is a preparatory program for the use of Copernicus Expansion/NG data. Strong support by MS and EARSC.

With a [multi-mission approach](#).

WHY

Supporting the integration of new Copernicus Expansion/NG datasets towards future operational working practices and promote European leadership for space systems where competitors are already active and boost digital commercialisation (ref. [EARSC workshop 2021](#) with D-EOP).

LSTM

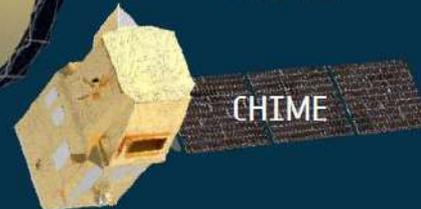

ROSE-L

HOW

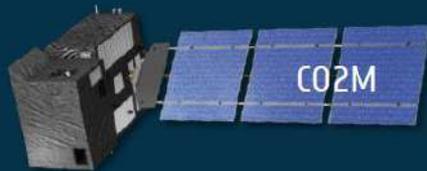

- Build the [necessary expertise in the various science and application domains](#) and sectors (academia, value adding companies) to prepare future downstream services.
- Ensure [readiness for rapid uptake](#) by users and stakeholders of derived information products.

CIMR

CHIME

CO2M

- [Readiness](#) of science and downstream analytics to address societal/environmental challenges.
 - Act as 'de-risking' factor and incentive for growth to [maximise return-on-investment](#).

EFFECTS

SUP Fundamental research and algorithm/products development/validation components

- Consolidate the scientific basis for key algorithms, novel methods and new products addressing innovative aspects beyond the single primary mission objectives and especially focusing on synergistic aspects.
- Generate recommendations with respect to the future Sentinel satellite fleet as a system-of-systems and the development of multi-mission retrieval algorithms and products.
- Build the necessary expertise in both the European science community and downstream industry sectors with respect to the new instruments and their exploitation both for science and applications.

SUP Fundamental research and algorithm/products development/validation

- **ITT (~600KEuro) - SWOT Data analysis and synergistic study for S3NG preparation:** Assessment SWOT capabilities (imaging interferometer dedicated) in preparation for S3-NG and exploration of synergies with SAR nadir altimeters. Data will be available at Launch + 9 months. This study will access and process SWOT mission data in synergy with other datasets to investigate the scientific content of the measurements available and develop innovative approaches to exploit the measurements for ocean, inland waters, cryosphere (sea ice) and other new scientific domains. Q4, 2024
- **ITT (~800KEuro) Polar Science Multi-mission Foundational Experiment (S1, ROSE-L, CMIR, CRISTAL)** explore opportunities and advance fundamental understanding of the interactions of different frequencies with snow, ocean and ice under different conditions for the development of advanced synergistic products and investigate the interplay between sea ice extend, sea ice deformation and sea ice thickness (snow on sea ice). Q4 2024.
- Projects will include a combination of campaigns for dedicated in-situ data, exploitation of proxi-datasets from existing missions, simulated data, including the potential to use/develop a community model based on open source modular approaches to enhance ocean, sea-ice and snow multi-mission simulations..

SUP Fundamental research and algorithm/products development/validation

ITT (Budget: 2-2.5MEuro) – SAR SUP: Set of parallel studies to support early development of advanced algorithms and products with focus on SAR multi-frequency synergic aspects and advanced polarimetry studies (recommendations from POLINSAR, SeaSAR, FRINGE) including C-band SARs, L-band SARs (SAOCOM, NISAR, ALOS PALSARs), SARs in other frequency bands (ESA Earth Explorer BIOMASS, NovaSAR-1 S-band, X-band new space sensors etc.).

Topics will include also Polar related domains: e.g.,

- **Glacier** velocity and processes characterisation;
- Multifrequency SAR **snow products** including dry/wet extend, liquid water content at different depths, snow density, snow depth and related products: including SWE
- Novel synergic opportunities for **SAR ocean retrievals** with focus on synergistic sea state, wave, winds and currents also in Polar regions...

Next Earth Explorer Mission

P-band synthetic aperture radar, the Biomass mission is designed to deliver crucial information about the state of our forests and how they are changing, and to further our knowledge of the role forests play in the carbon cycle.

Fluorescence Explorer will yield information about the health of the world's plants to improve our understanding of how carbon moves between plants and the atmosphere and how photosynthesis affects the carbon and water cycles.

FORUM's observations of the far-infrared will close the gap between the microwave and mid-infrared spectral range. For the first time the full spectral range in the Earth system is accessible through TOA observations.

Harmony involves two satellites in formation with Copernicus Sentinel-1 quantify the processes that govern the exchange of momentum, heat and moisture between the ocean surface and the air above driving weather patterns and climate.

Harmony in a nutshell

Harmony is ESA's Earth Explorer 10 mission, comprised of two companion satellites in a loose convoy with Sentinel-1D (along-track separation ~ 350 km) Its payload suite consists of a passive SAR and a multi-view TIR instrument

Cross-track Interferometric phase covering land applications like glaciers, permafrost, volcanoes.

Stereo phase covering 3-D surface deformation ocean applications: surface motion, surface winds, sea surface temperature, cloud motion.
