

Evaluation of the ATLID integrated surface returns for calibration and retrieval of an independent column-integrated aerosol optical thickness Diko Hemminga, Gerd-Jan van Zadelhoff, Dave Donovan Royal Netherlands Meteorological Institute (KNMI), De Bilt, the Netherlands 2<sup>nd</sup> ESA-JAXA EarthCARE In-Orbit Validation Workshop 17 - 20 March 2025 | ESA-ESRIN | Frascati (Rome), Italy

### Lidar surface return

- ATLID: EarthCARE's HSRL lidar of 355 nm at near-nadir incidence
- Vertical profiles of aerosols, clouds, and their optical properties
- Global, direct, measurement of UV surface reflectivity: lidar surface return
  - Part of the A-FM product
  - Mie co-polar, Mie cross-polar and Rayleigh co-polar channel
  - Over land and ocean
- Focus: ocean lidar surface returns in the co-polar Mie channel for retrieval of atmospheric transmission characteristics: aerosol optical depth
- Aerosol monitoring over ocean and inter-processor evaluation

### Aerosol optical depth over ocean

- Column-integrated AOD over ocean from attenuated co-polar Mie backscatter
- Evaluation: Independent measure for evaluating the A-PRO, A-LAY and ACM-CAP retrievals

- Lidar surface return: Signal integrated over the surface pixels for any column where the surface is detected, on the ATLID native grid
- AOD retrieval is based on a parametrization of the surface reflection

# Aerosol optical depth over ocean (2)

- Cox and Munk (1954): reflection from the ocean surface
- Relationship between sea surface slope and lidar backscattered signals: sea surface reflectance depends on 10m wind speed
- CALIOP onboard CALIPSO: successful relation LSR ↔ wind speed
- ALADIN onboard Aeolus investigated by Lev Labzovskii (KNMI)
  - 35° incidence: no direct reflection
  - Insufficient sensitivity of LSR to wind speed for AOD retrieval

### Co-polar Mie surface backscatter

**Baseline AC** 

• Global co-polar Mie surface backscatter, corrected for molecular (Rayleigh) attenuation over ocean

Global wind speed from X-MET product, based on ECMWF forecast

# Co-polar Mie surface backscatter

#### **Baseline AC**

• Global co-polar Mie surface backscatter, corrected for molecular (Rayleigh) attenuation over ocean

• Global wind speed from X-MET product based on ECMWF forecast

#### Relations between LSR, AOD and windspeed

 Surface-integrated attenuated backscatter vs. 10-m wind speed

JAXA

· e e sa

**Baseline AC** 

### Relations between LSR, AOD and windspeed

- Surface-integrated attenuated backscatter vs. 10-m wind speed
- ATLID returns have sufficient signal to make aerosol optical depth retrieval
- Employ Lev Labzovskii's Lidar Aerosol Retrieval based on Information from Sea Surface of Aeolus (LARISSA) algorithm

**Baseline AC** 

#### Relations between LSR, AQD and windspeed

- Surface-integrated attenuated backscatter vs. 10-m wind speed
- ATLID returns have sufficient signal to make aerosol optical depth retrieval
- Employ Lev Labzovskii's Lidar Aerosol Retrieval based on Information from Sea Surface of Aeolus (LARISSA) algorithm
- Current results may still contain thin clouds: total optical depth

# Discussion and future, work

- Removal of cirrus clouds for AOD retrieval
- Different windspeed parametrizations are available
- Comparison with A-PRO, A-LAY and ACM-CAP retrievals
- Investigation of sub-surface scattering effects from Rayleigh channel return

# Conclusion

- ATLID shows sensitivity of lidar surface returns to wind speed
- This enables independent retrieval of aerosol optical depth of the atmospheric column above the surface

 Thanks to my coauthors, to Lev Labzovskii, to the KNMI-local EarthCARE team and the EarthCARE DISC

and thank you for listening!
