

International workshop on AI Foundation Model for EO

5-7 May 2025 | ESA ESRIN - Frascati, Italy

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

J. Lampert, P. Fanta-Jende, J. Salzinger, L. Beltrame,
P. Thiele, D. Duarte , B. Schumacher, C. Briese

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

Massive amount of EO data available.

Pretrained Foundation Models offer a great opportunity for scientists.

Fine-tuning for domain-specific applications challenging.

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

Sentinel-Assisted Forestry Insight and Research - AI for Climate-Responsive Forest Monitoring in Mountainous Regions

- Call: Digital Twin Austria
- Project duration: 3 years
- Project start: 1.11.2024
- Coordinator:

Associated Partners

Stakeholders

Project Partners

Key Challenges for Remote Sensing-Based Forest Monitoring:

- Increased monitoring frequency is necessary (due to natural hazards and climate change-related effects).
- Shadowing effects caused by mountainous terrain and cloud shadows in optical Earth observation data hinder monitoring:
 - Data is not directly usable
 - Delays detection and timely response
 - Leads to ecological and economic consequences (e.g., late detection of damage events)

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

Topographic correction:

- Benefit: Accounts for differences in illumination due to terrain.
- Approach: Radiometric correction of data using a digital elevation model.

G. Yin *et al.*, "PLC-C: An Integrated Method for Sentinel-2 Topographic and Angular Normalization," in *IEEE Geoscience and Remote Sensing Letters*, vol. 18, no. 8, pp. 1446-1450, Aug. 2021, doi: 10.1109/LGRS.2020.3001905

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

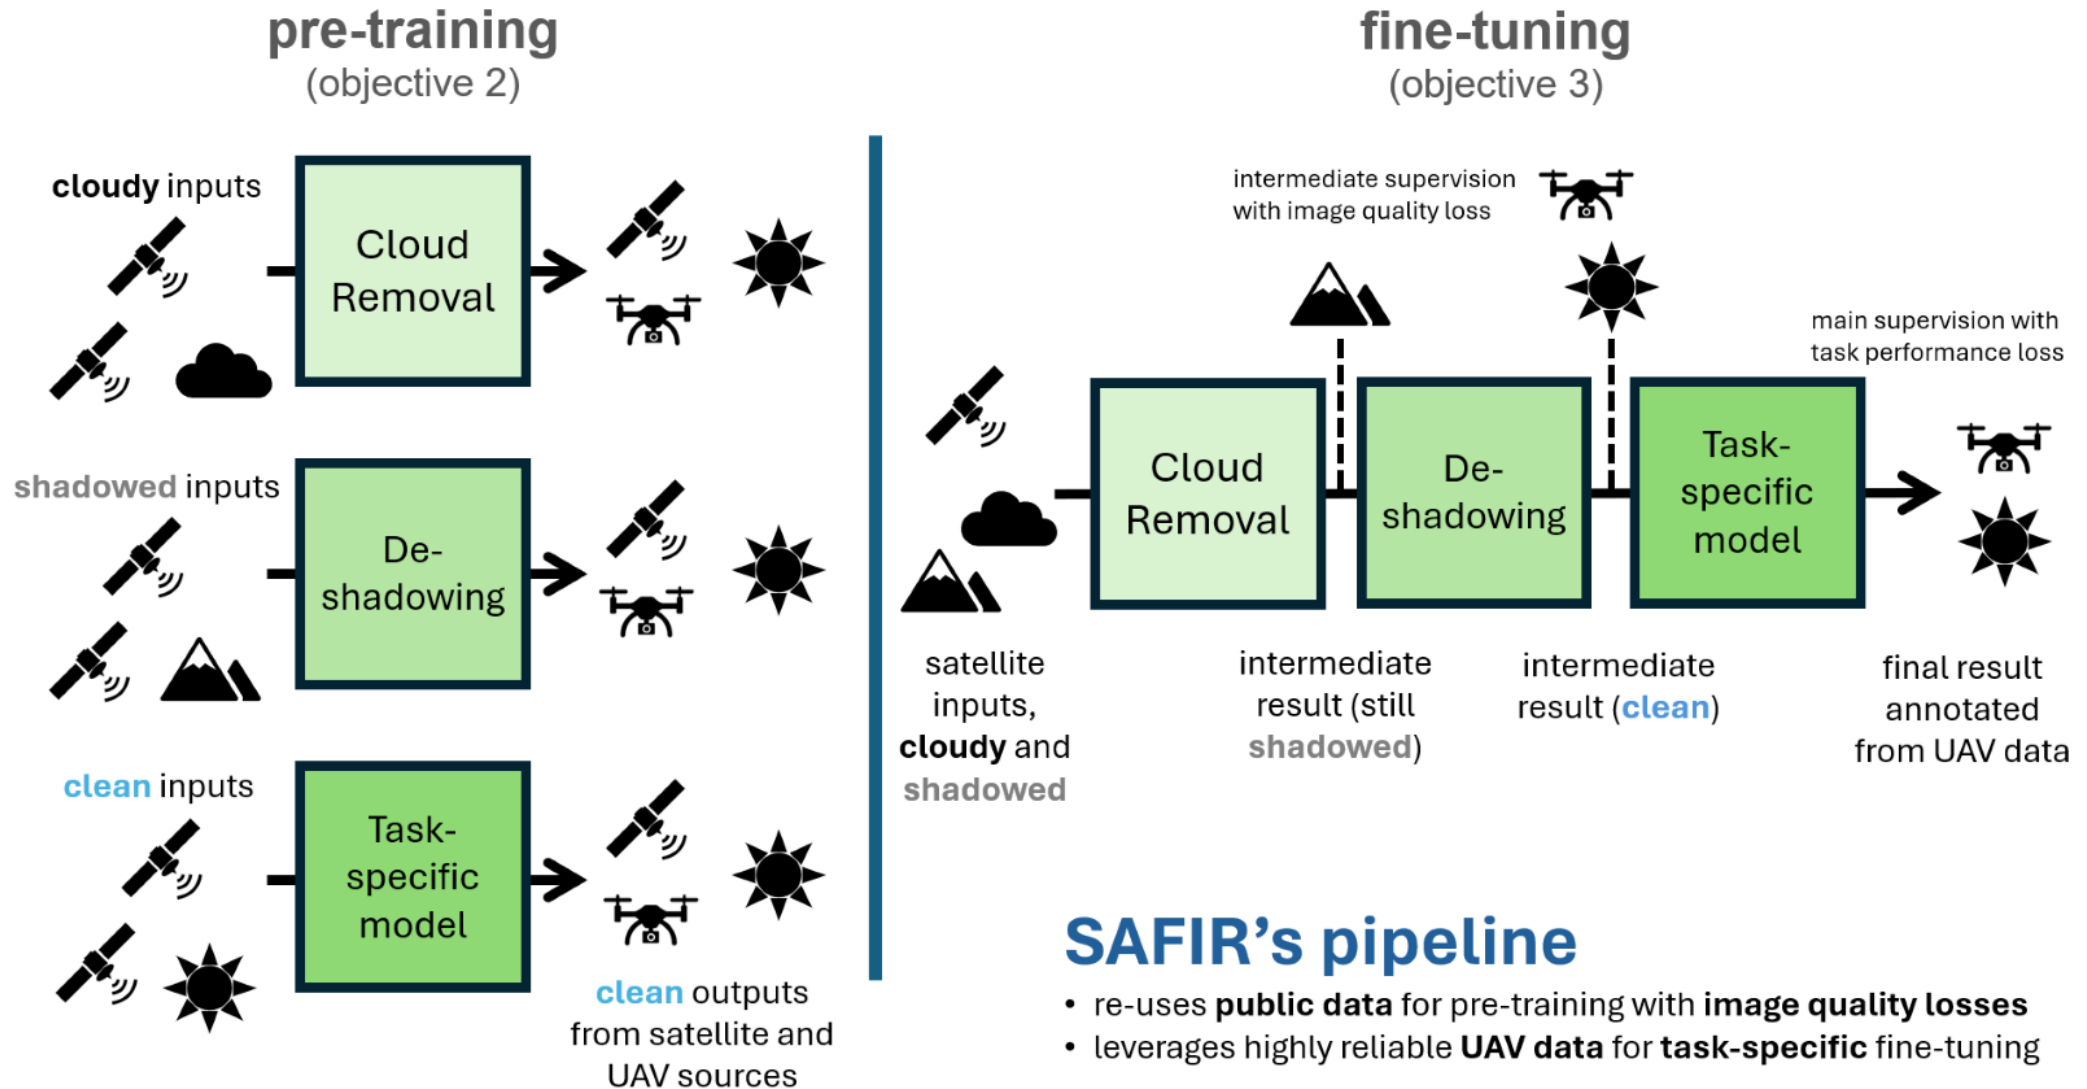

Deshadowing and declouding of Sentinel-2 images:

- Benefit: Additional images for training of downstream tasks.
- Approach: Detection and correction of clouds and cloud shadows using neural networks and radar data.

Meraner, Andrea, et al. "Cloud removal in Sentinel-2 imagery using a deep residual neural network and SAR-optical data fusion." *ISPRS Journal of Photogrammetry and Remote Sensing* 166 (2020): 333-346.

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

Task 1: Windthrow Detection

- Benefit: Rapid detection of windthrows
- Products: Binary raster layer
- API/WebUI: Data layer integrated as a mock-up for demonstration purposes in GTIF

Task 2: Anomaly Detection

- Benefit: High-frequency forest anomaly detection
- Products: Raster layer time series
- API/WebUI: Data layer integrated as a mock-up for demonstration purposes in GTIF

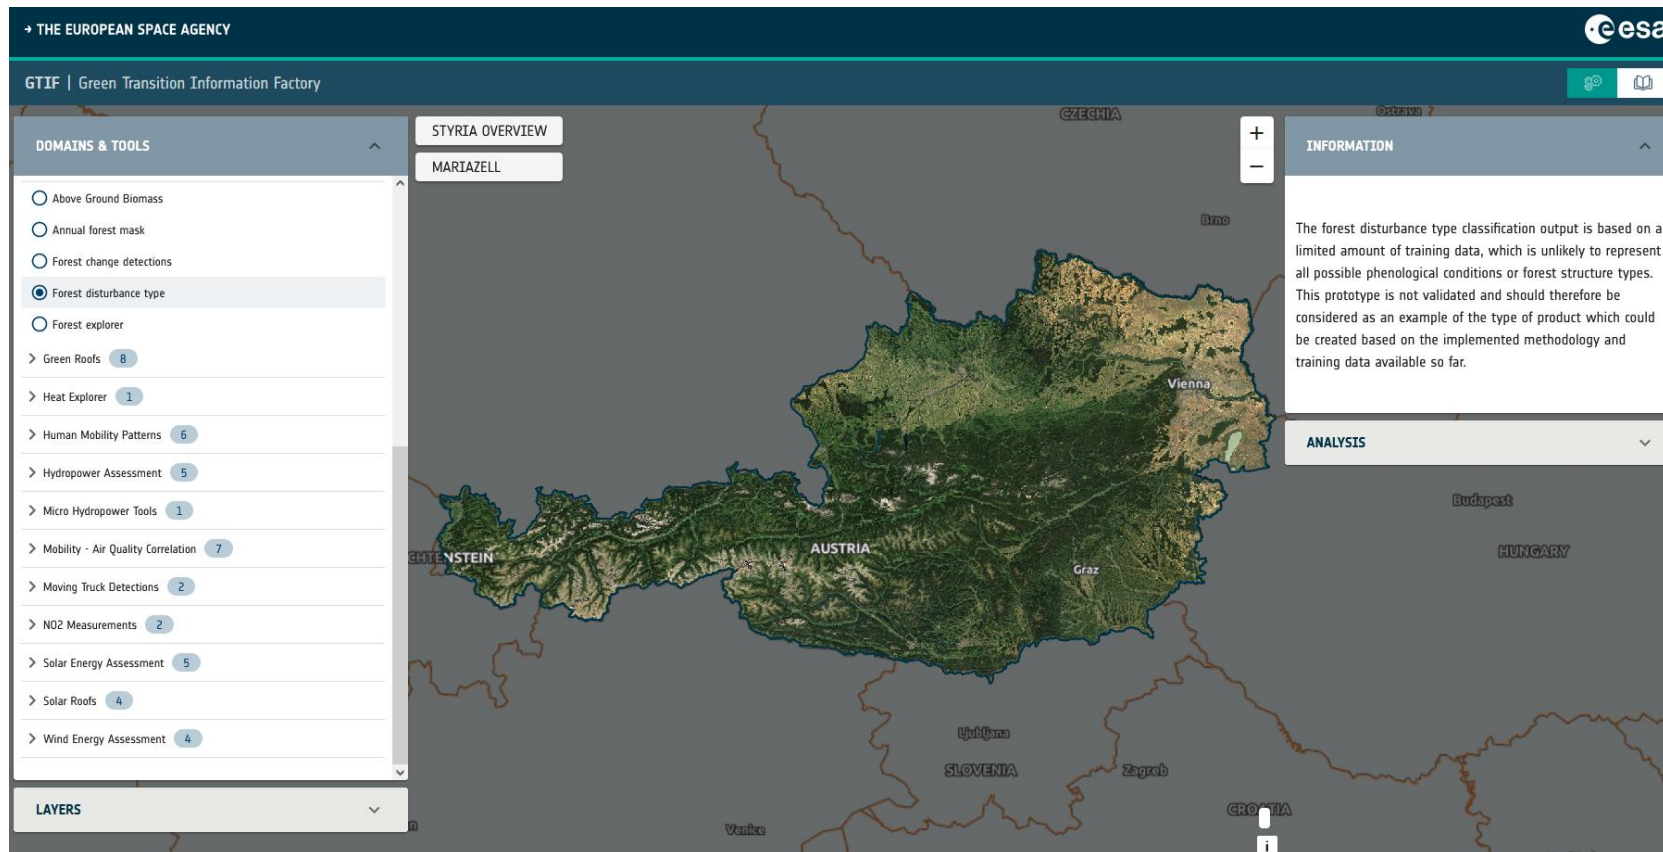

Deigle, W.; Brandmeier, M.; Straub, C. A Hierarchical Deep-Learning Approach for Rapid Windthrow Detection on PlanetScope and High-Resolution Aerial Image Data. *Remote Sens.* **2020**, *12*, 2121.

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

ESA's Green Transition Information Factory (<https://gtif.esa.int/>)

European data and analytics infrastructure concept:

- First demonstrator in Austria.
- Combines Earth Observation, cloud-computing and cutting-edge analytics.
- SAFIR will provide results for GTIF.

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach

Tackling downstream tasks effectively requires domain knowledge.

More diverse, multi-modal datasets for fine-tuning foundation models are needed.

Development of new foundation models should be guided by needs of the EO community.

Addressing cloud- and shadow-induced data gaps in complex terrains for forest monitoring: Advancing EO foundation models with a multi-resolution approach
