

Biogeochemical models, data assimilation and satellite remote sensing

Camila Serra Pompei

CARLSBERGFONDET

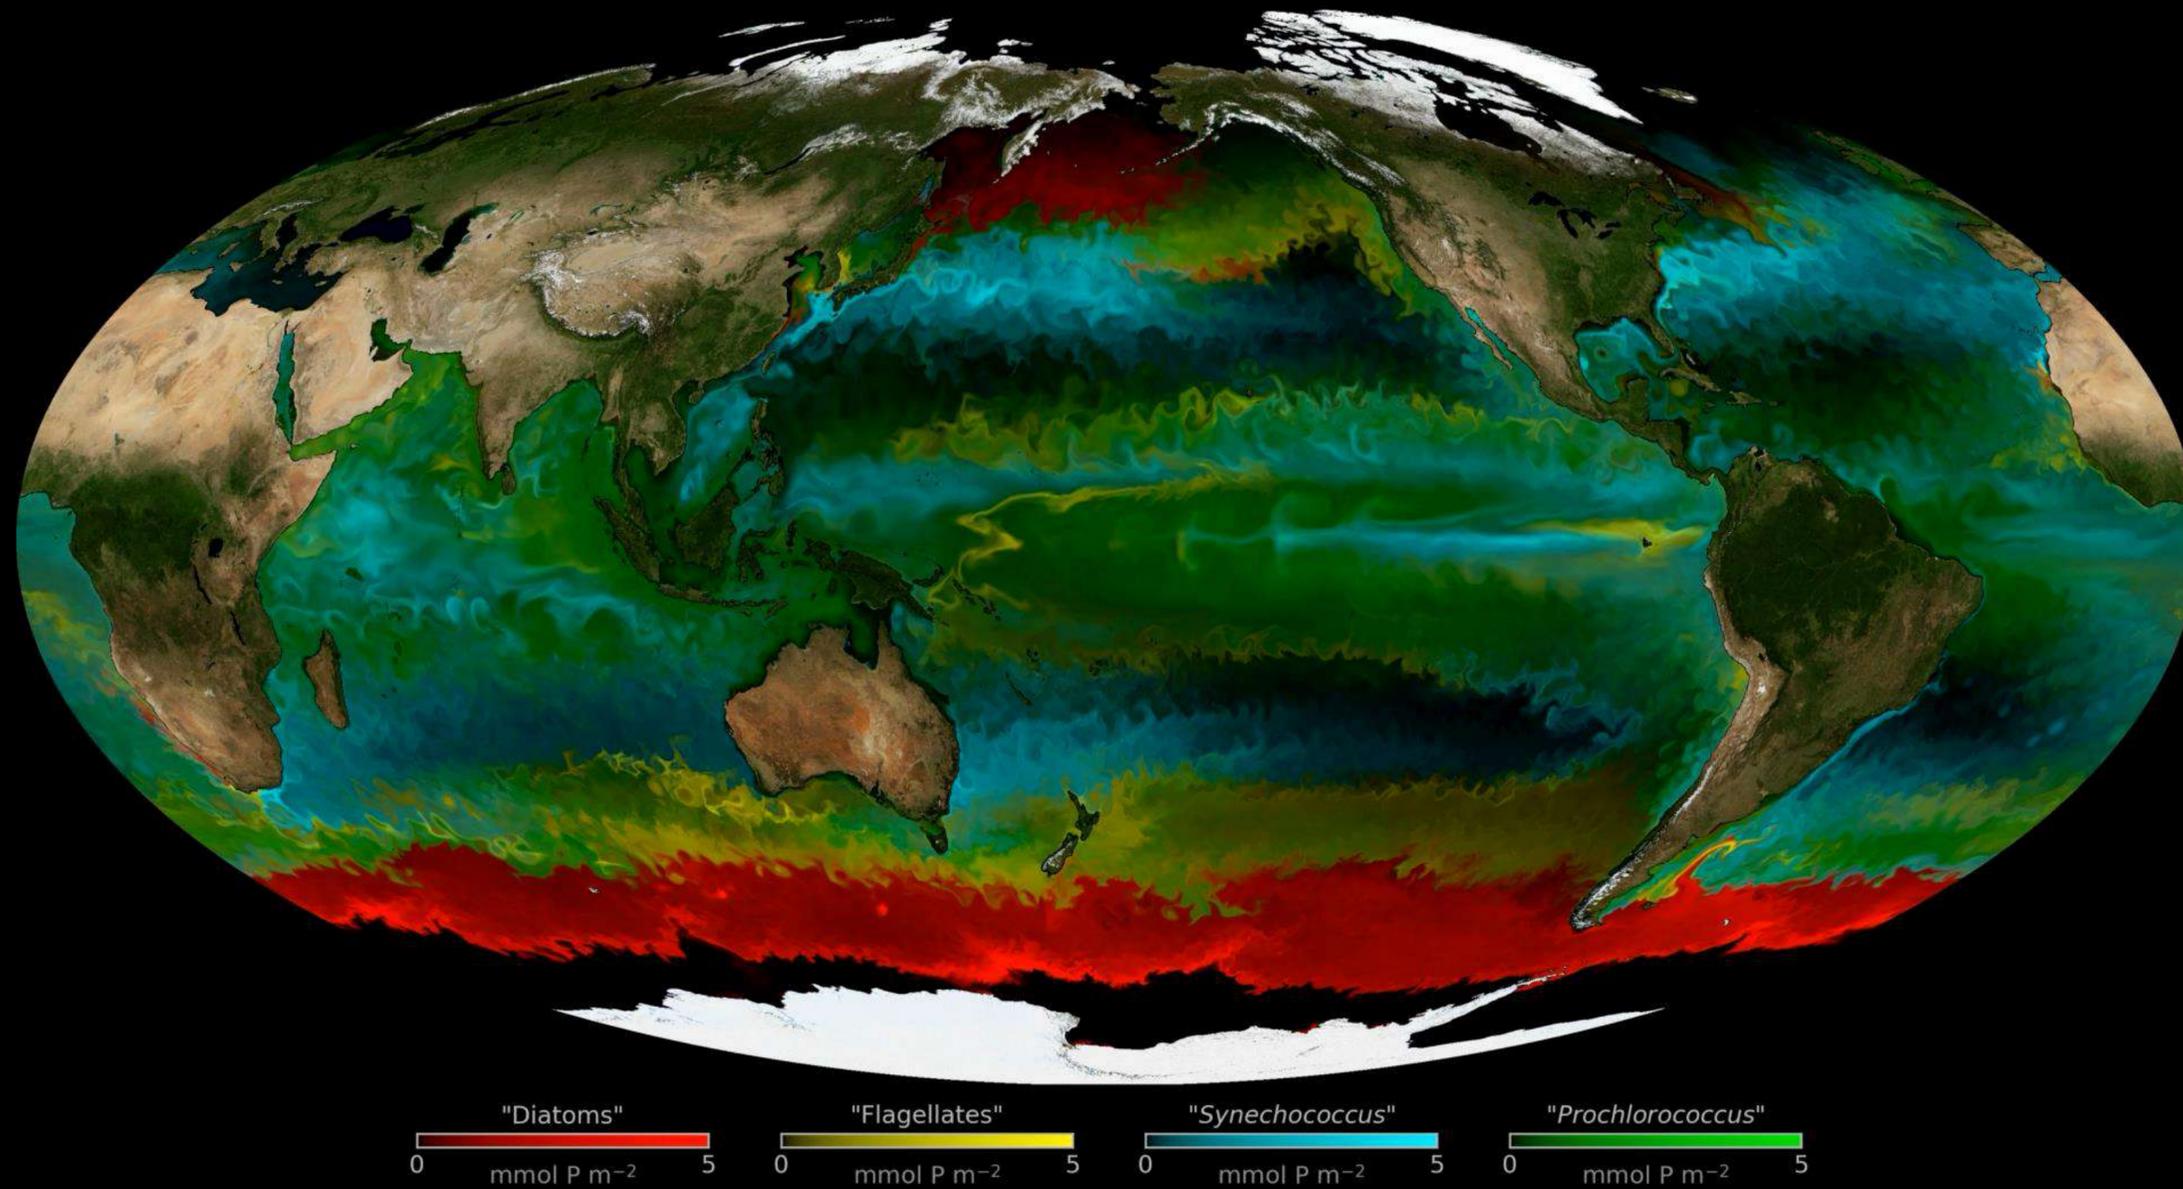

Data is scarce, and models can help fill the gaps.

But, Greenland is

a complex system of fjords, shelf regions, and slopes,

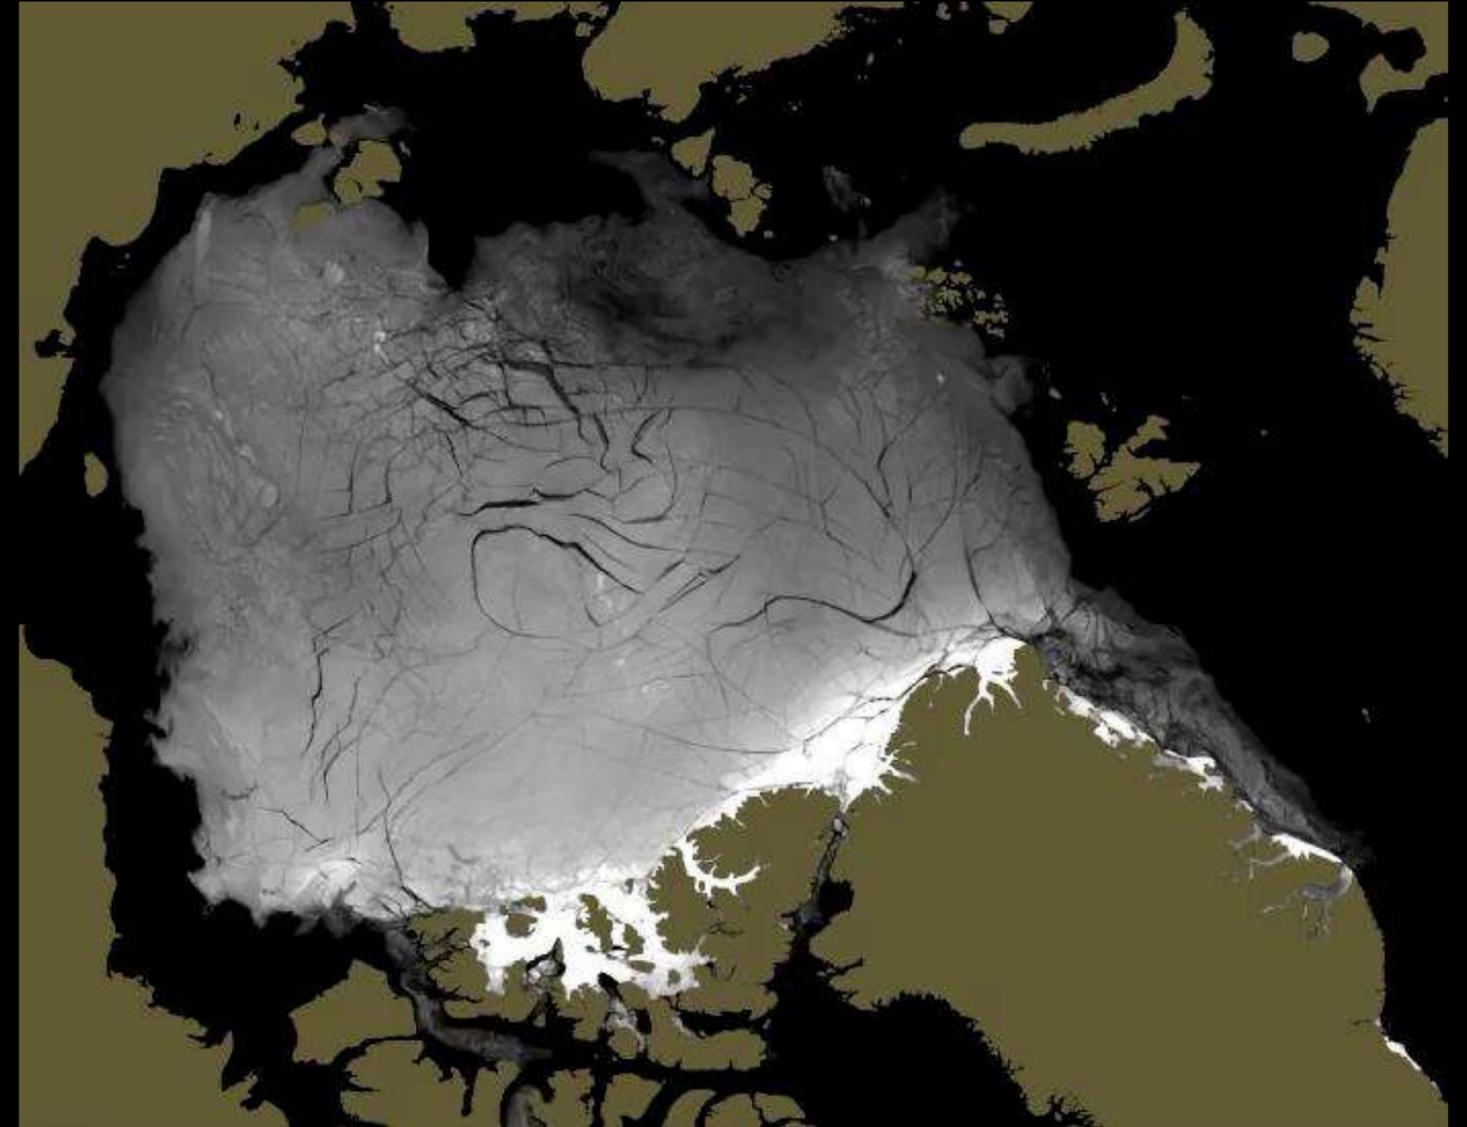

all influenced by the Ice sheet and sea-ice dynamics.

Global biogeochemical models

Global models

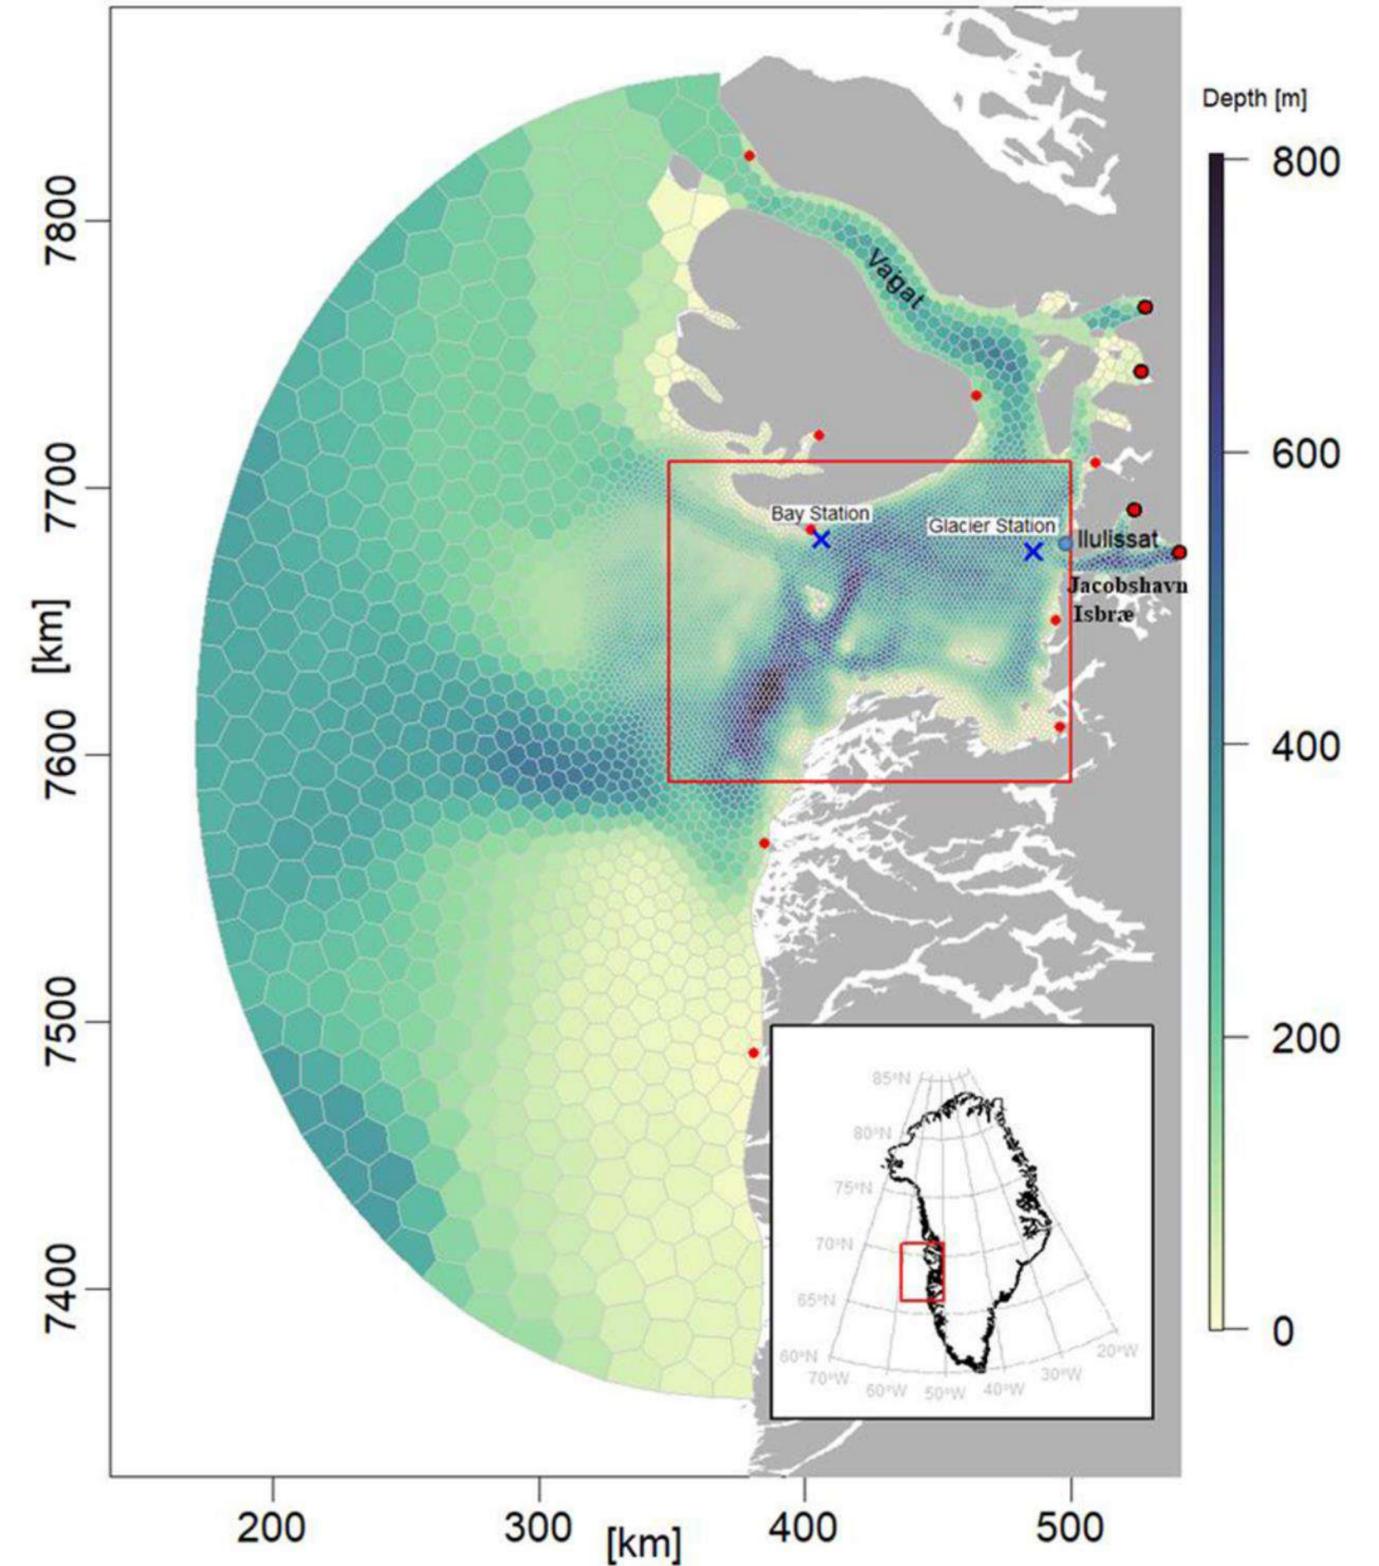

- ▶ Low Resolution for coastal systems
- ▶ Land-Ocean Aquatic Continuum processes might not be well represented

Effective ice thickness in the MITgcm ECCO model.

Regional models

- ▶ Higher resolution
- ▶ Land ocean aquatic continuum better represented
- ▶ Often of limited regions around Greenland (not for the entire Greenlandic marine ecosystem)
- ▶ Boundary conditions need to be defined

Disconnection between the global vs the regional modeling community

- Use the same ecosystem model globally and regionally (?)
 - Improve boundary conditions
- Efforts in the global modeling community to:
 - Increase the spatial resolution
 - Improve processes of the land-ocean aquatic continuum

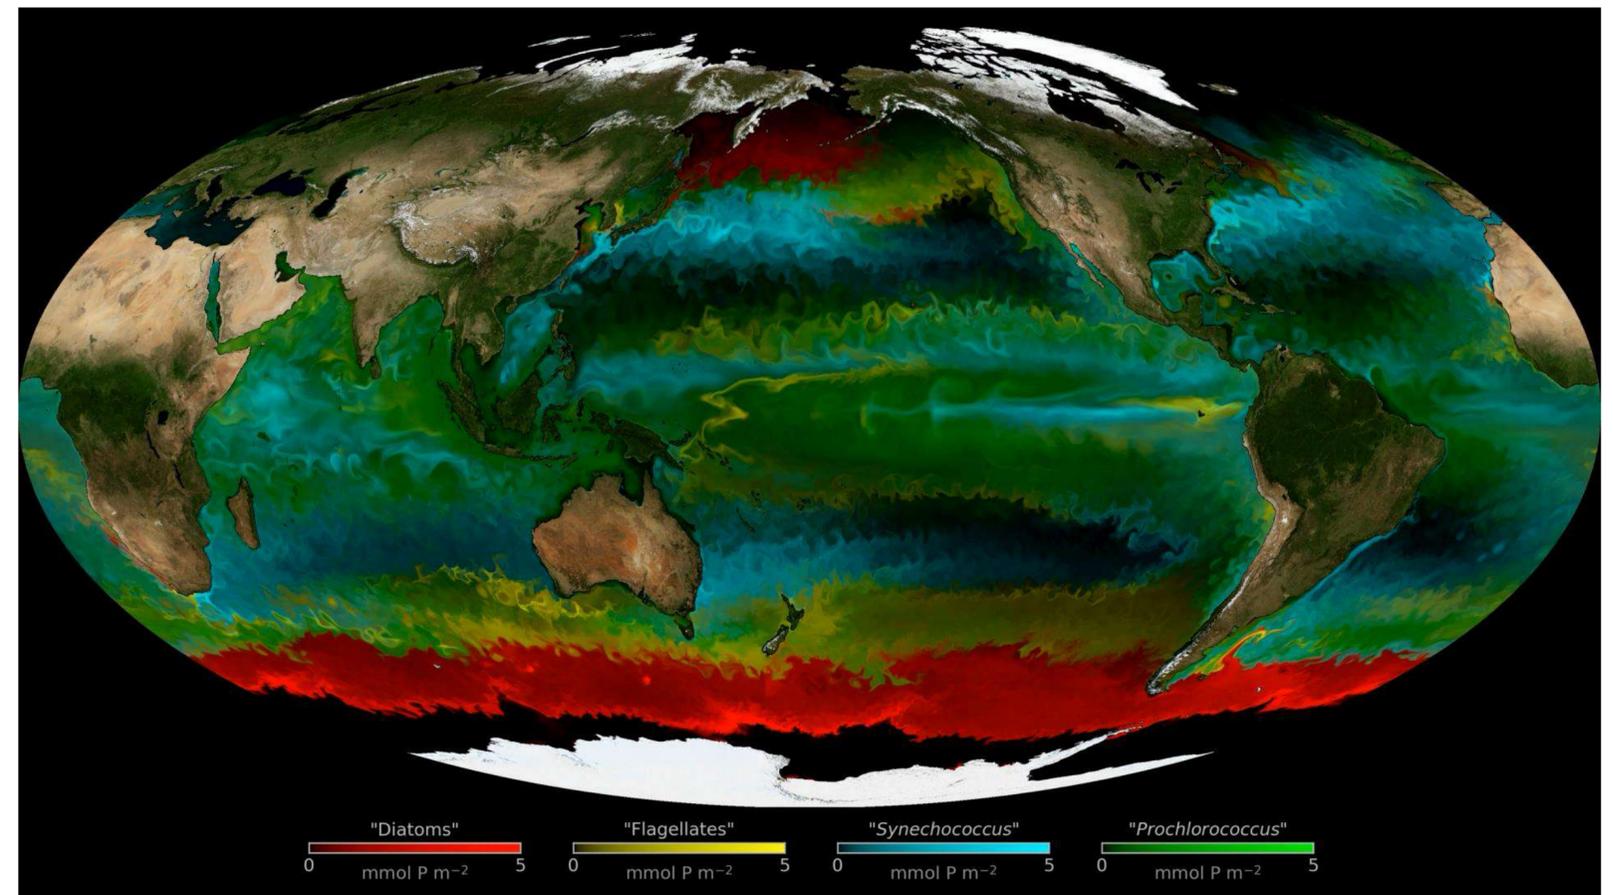

Ecological complexity

From simple “NPZ” models

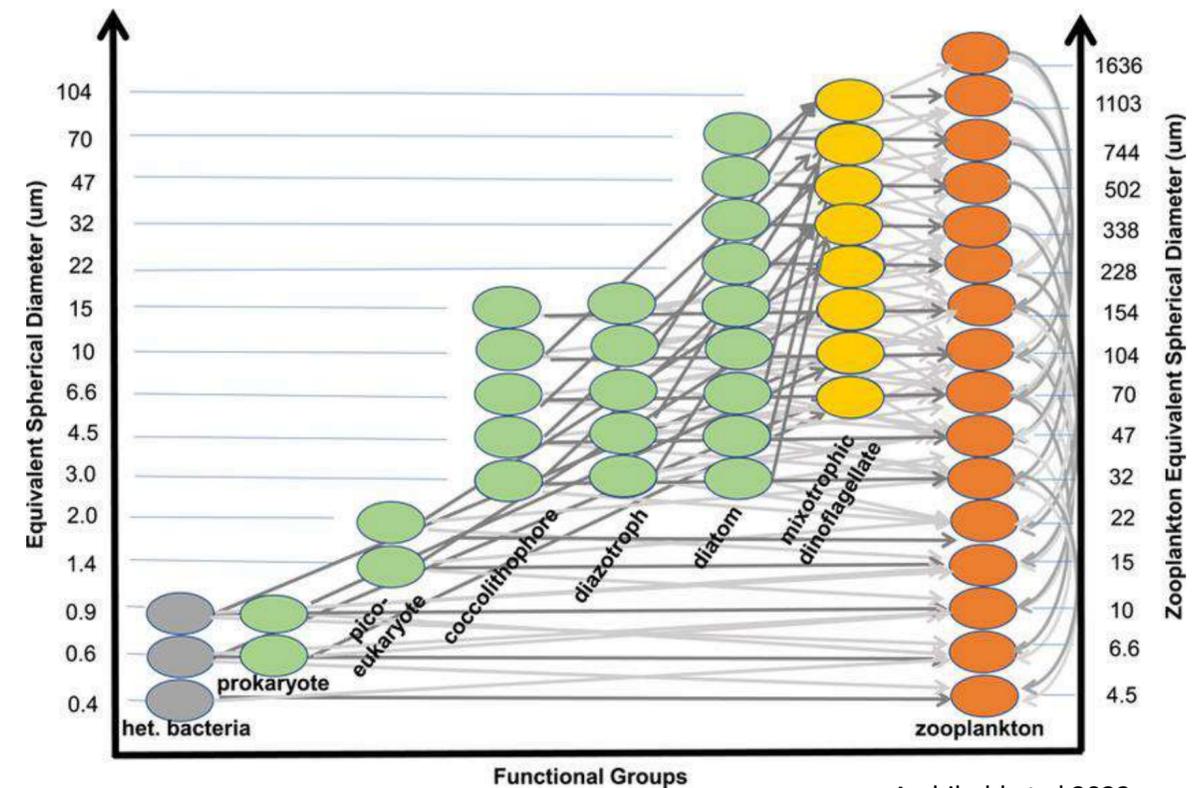

to

Complex size-resolved plankton functional groups

But often not correctly parameterized to represent Arctic ecosystems (at least in global models)

Archibald et al 2023

ArcFish - Digital twin

- ▶ Data assimilated
- ▶ Biogeochemical components
- ▶ Simulations of zooplankton biomass and production as indices for fish production

TOOL: DISKO BAY ECOSYSTEM MODEL (FLEXSEM-ERGOM)

See ArcFish poster of Marie Maar

Lower vs higher trophic levels

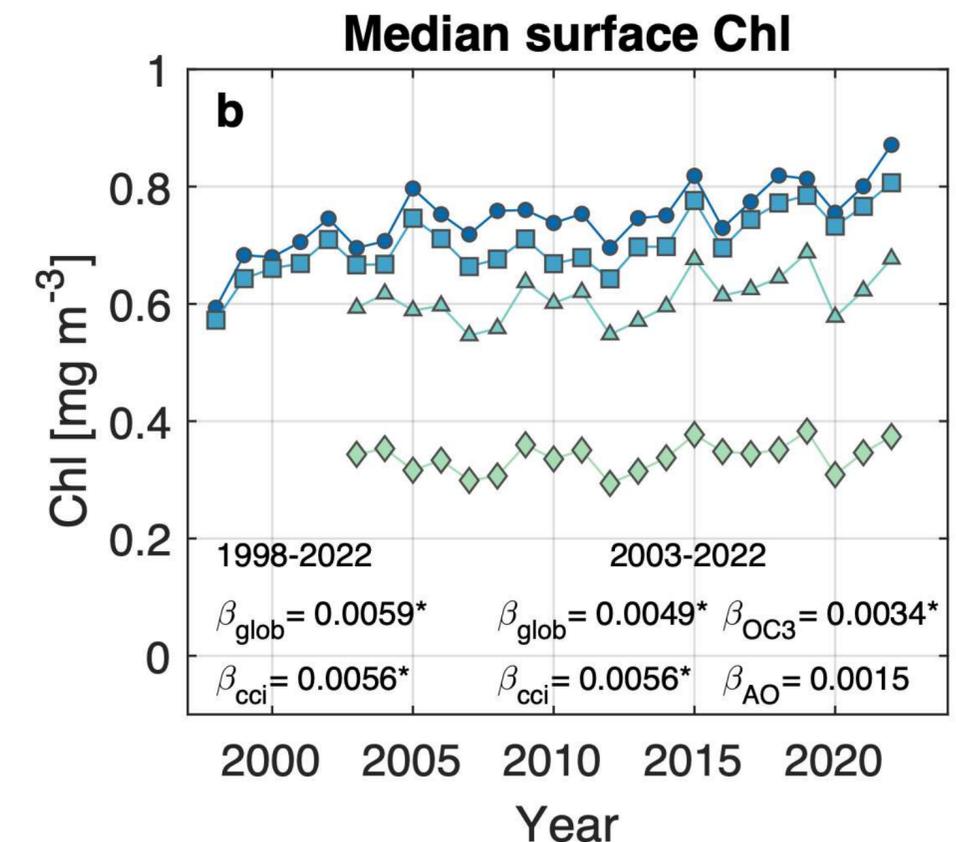

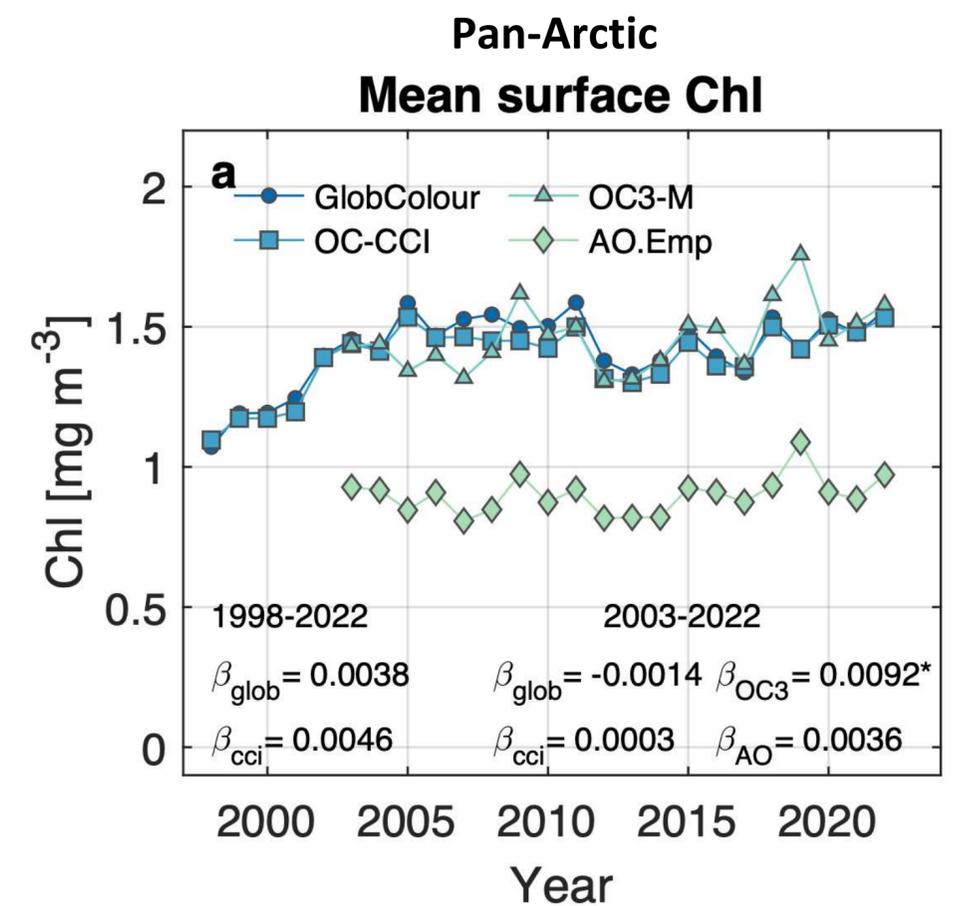

- ▶ Most models center on lower trophic levels due to their relevance in biogeochemical cycles
- ▶ “Larger” multicellular organisms important for fisheries
 - ▶ But behaviour of “large” organisms needs to be implemented
 - ▶ Recent efforts on the simulation of vertical diel/seasonal migrations of copepods in regional models
- ▶ Can be used as proxies for fisheries

Bandara et al 2021

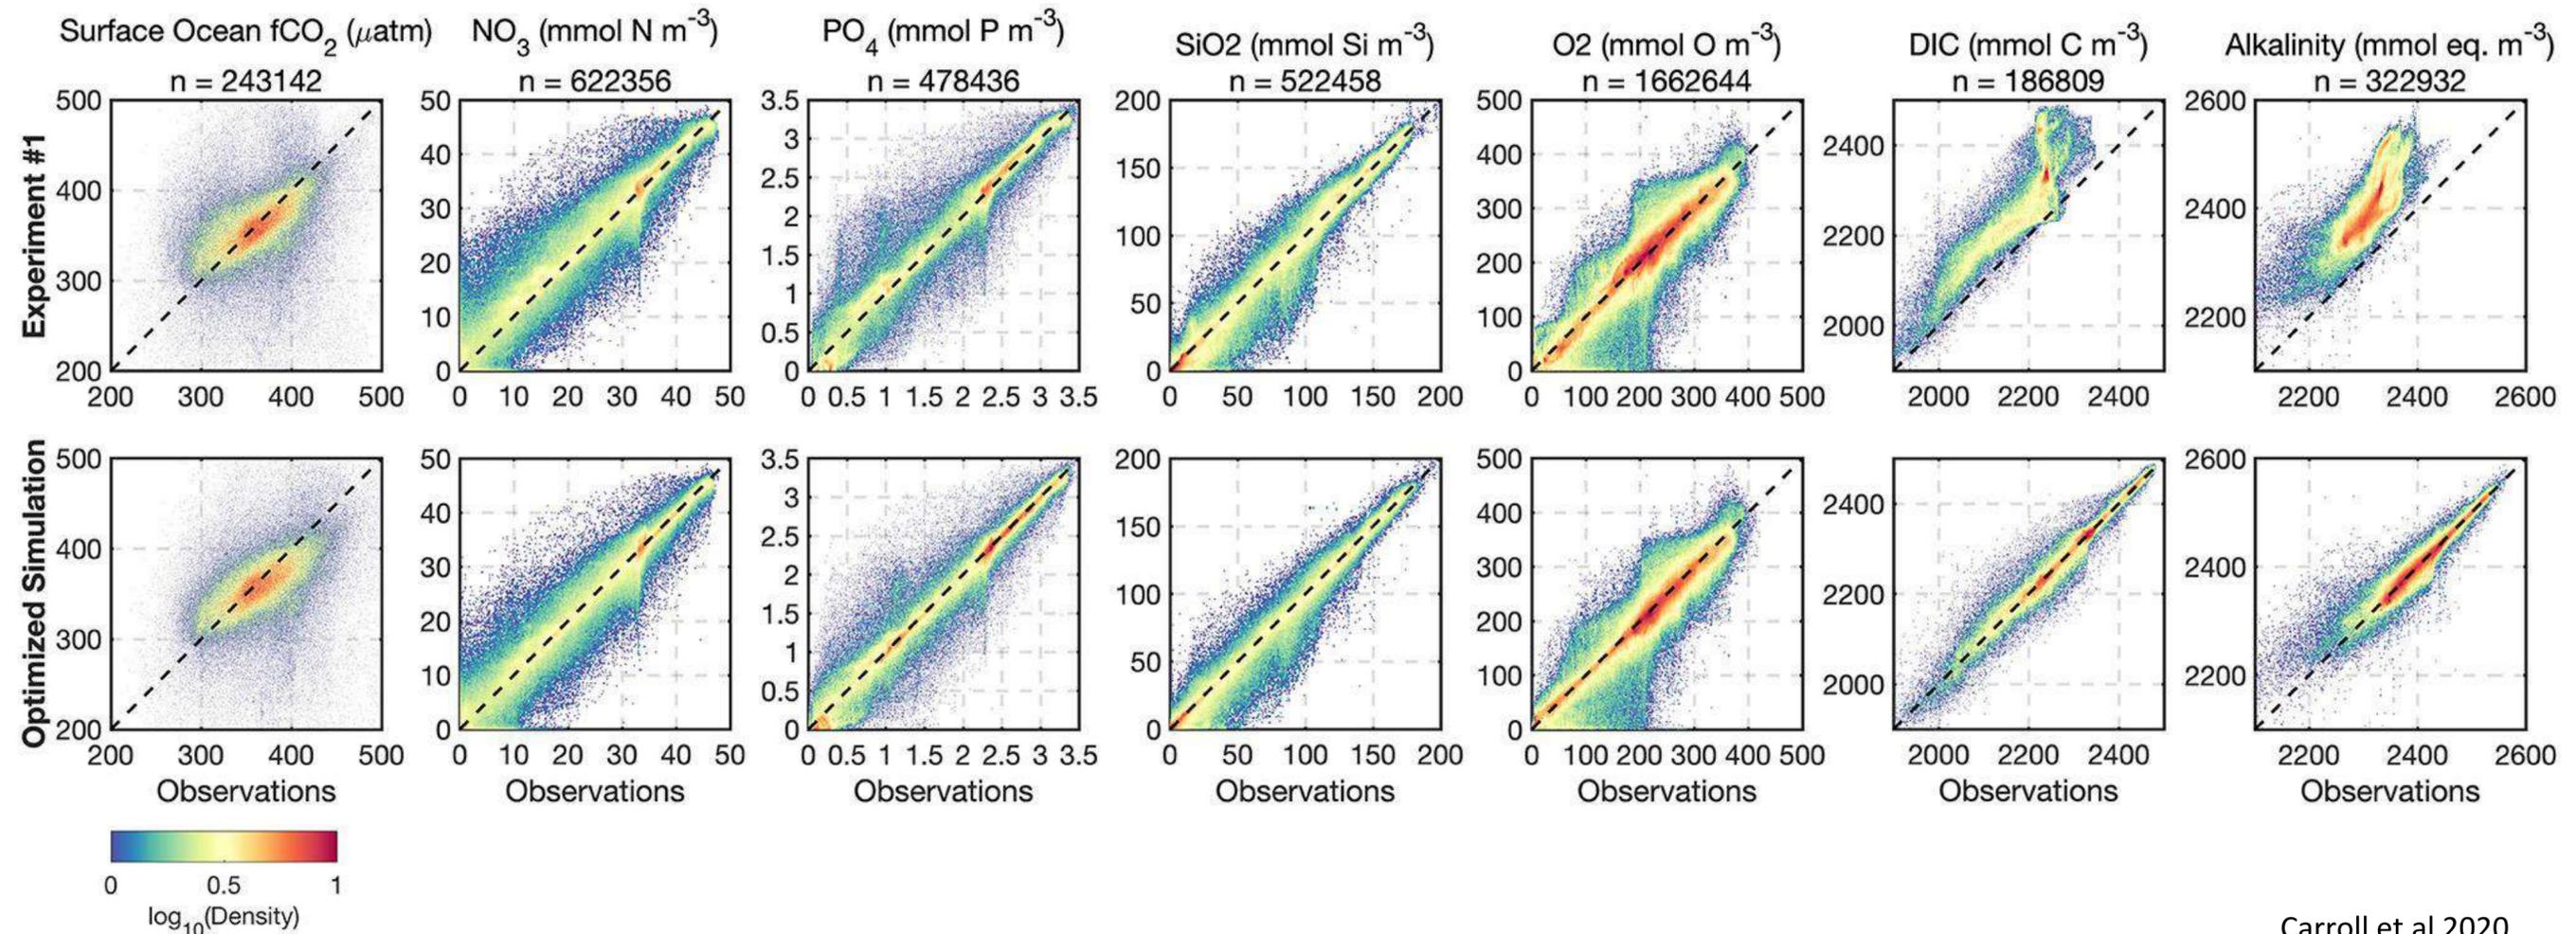

Data assimilation of biogeochemical variables

- ▶ Ecological data (e.g. phytoplankton/zooplankton biomass) is scarce, noisy and with high uncertainties
- ▶ Joint data-sets can be useful
- ▶ Satellite products can be very useful for assimilation, but:
 - ▶ No products for polar regions provided by agencies
 - ▶ Coastal products also not provided and often have high uncertainties

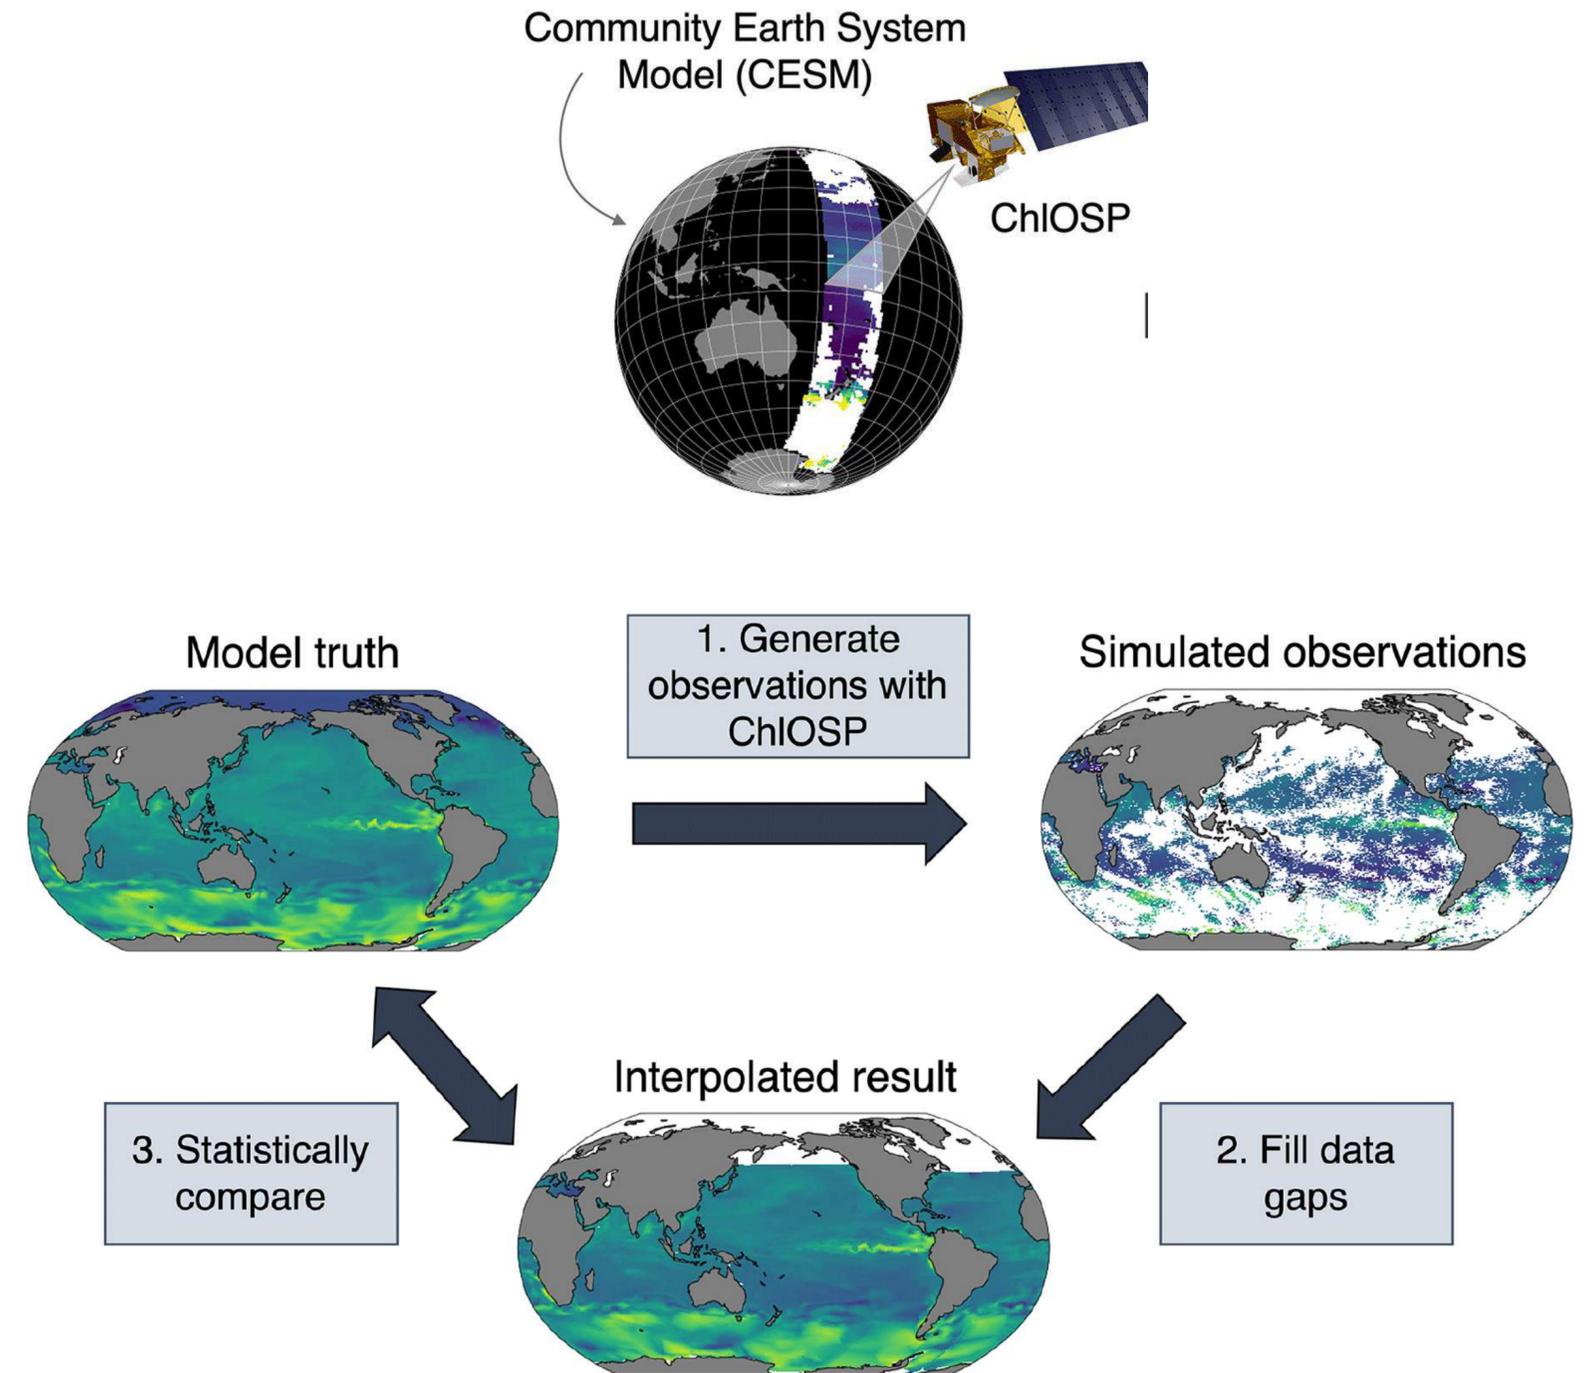

ECCO-Darwin model

- ▶ "Estimating the Circulation and Climate of the Ocean" (ECCO) consortium model (NASA)
- ▶ Makes the best possible estimates of ocean circulation and its role in climate
- ▶ An Arctic version of the model is being developed

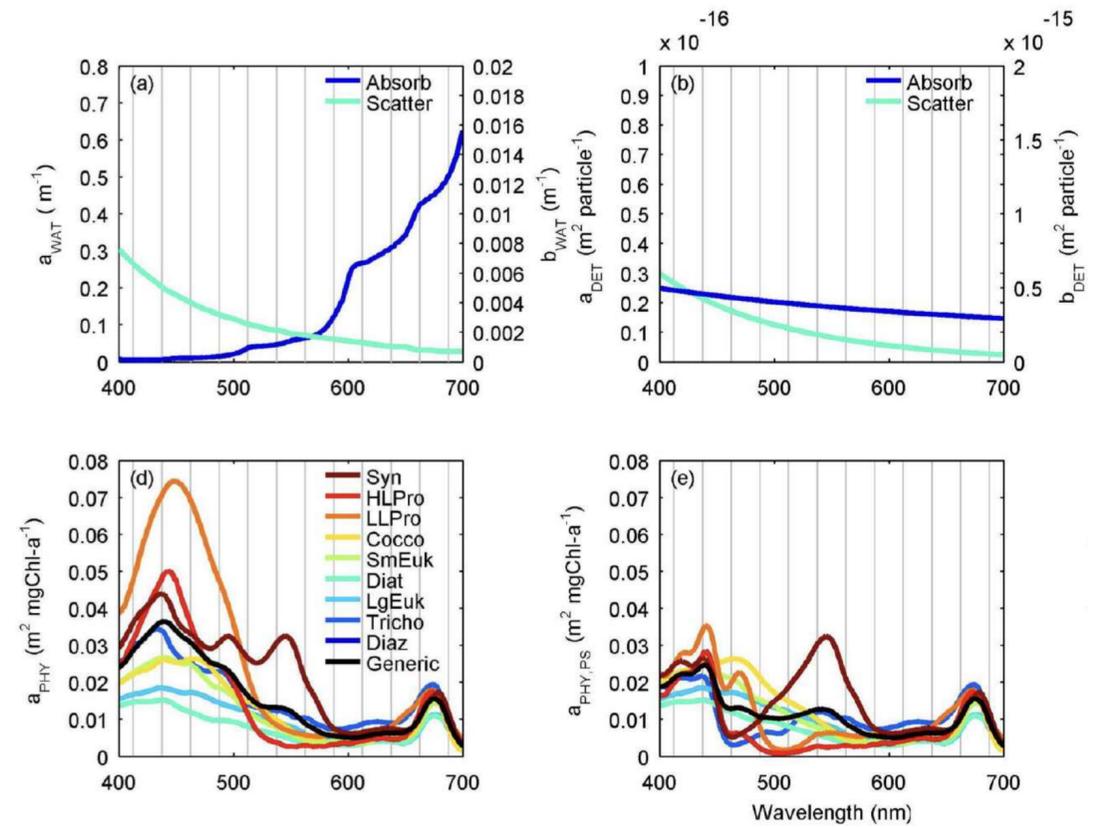

Using models as test-beds

- ▶ Provide a 3D interpretation of what satellites are seeing
 - ▶ Are changes in surface Chl representative of depth-integrated Chl changes?
- ▶ Effects of clouds and missing satellite data on predictions made with satellites
- ▶ Models that simulate Rrs and IOPs of components in the water can be used as test-beds for satellite algorithms

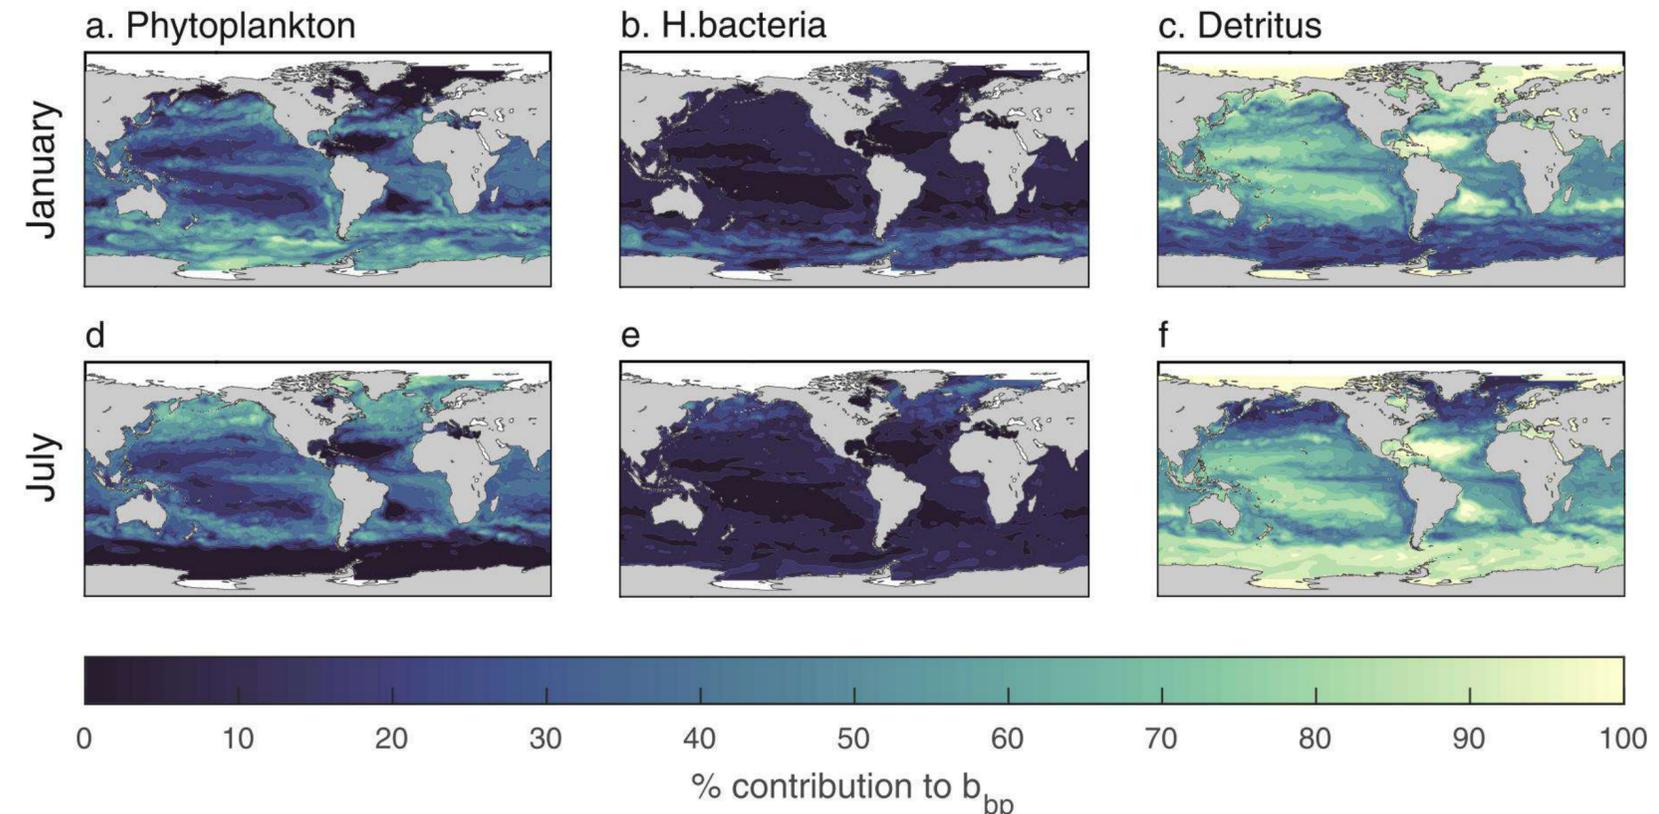

Using models as test-beds

- ▶ Provide a 3D interpretation of what satellites are seeing
 - ▶ Are changes in surface Chl representative of depth-integrated Chl changes?
- ▶ Effects of clouds and missing satellite data on predictions made with satellites
- ▶ Models that simulate Rrs and IOPs of components in the water can be used as test-beds for satellite algorithms

Dutkiewicz et al 2015

Serra-Pompei et al 2023

Priorities

- ▶ Communication between regional vs global modelers
- ▶ Improved representation of the land-ocean aquatic continuum in global models
- ▶ Satellite products for polar and coastal regions should be publicly available and of easy access (or at least reproducible from publicly available scripts)
- ▶ Common repositories where field data can be accessed
- ▶ Use of models as test-beds to organize campaigns or assess uncertainties of methods
