LIFE20 PRE/IT/000007

Remote sensing oriented nature-based solutions towards a NEW LIFE FOR DRYLANDS

Overview

In the framework of NewLife4Drylands LIFE Preparatory project (LIFE20 PRE/IT/000007, 2021-2024, <https://www.newlife4drylands.eu/>), this study addresses the computation of SDG 15.3.1 “Proportion of land that is degraded over total land area” indicator, adopted in the UNCCD’s Good Practice Guidance [1] to evaluate Land Degradation (LD) status of grassland coverage in Alta Murgia Protected Area (PA, IT9120007, southern Italy).

SDG 15.3.1 indicator is computed by integration of three main sub-indicators:

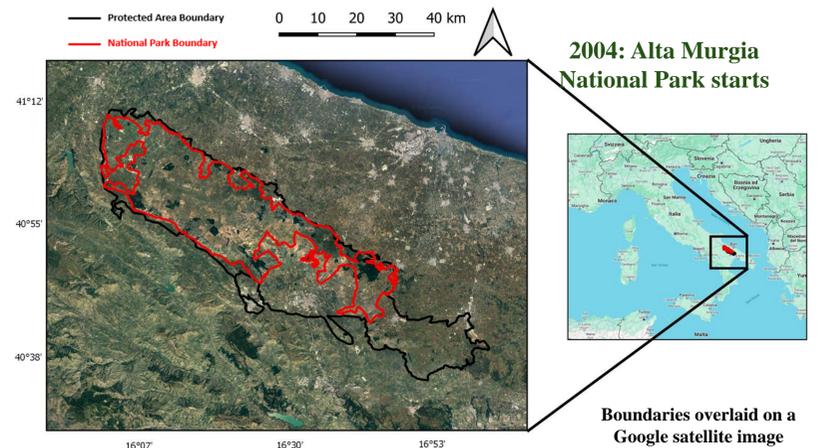

- Land Cover trend;
- Primary Productivity trend;
- Soil Organic Carbon (SOC) stock trend

To effectively aid PAs managers this study suggests:

- Additional sub-indicators related to pressures and threats affecting the site (e.g., fires);
- Sub-indicators computed at local scale as much as possible: free global/European databases not reliable at site-scale [2];
- LD in grassland coverage only was evaluated.

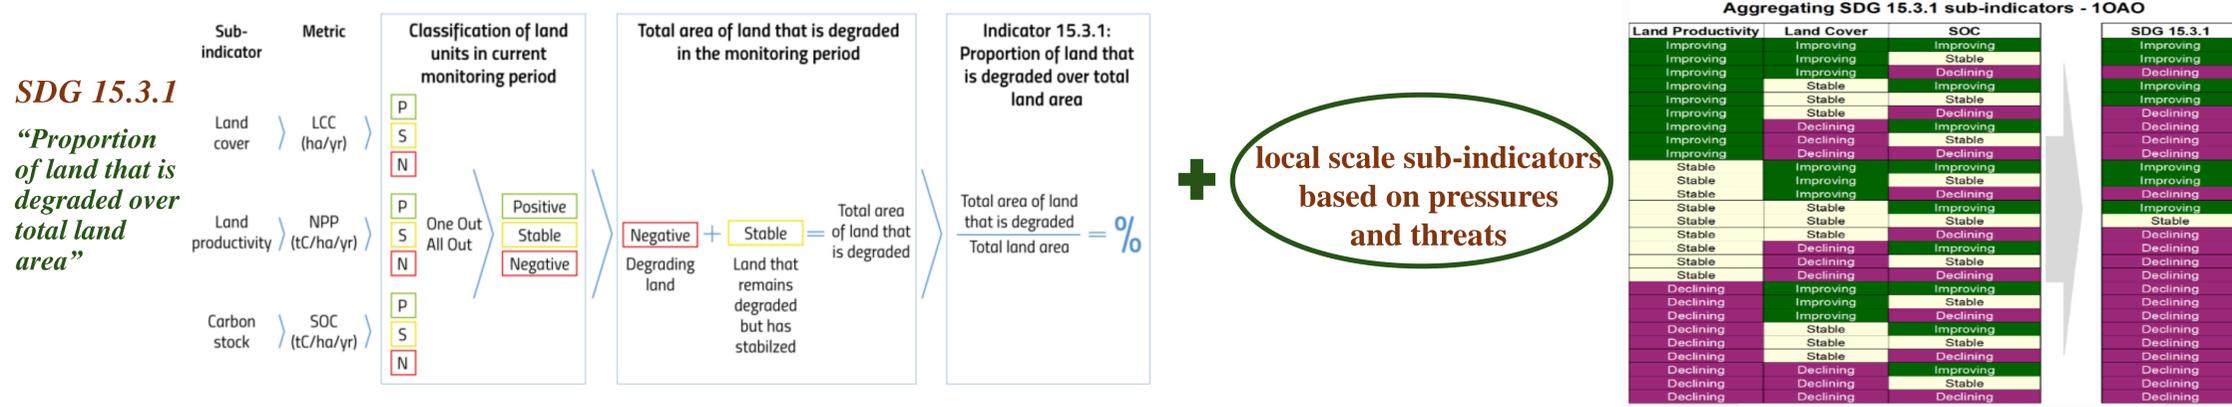

Study site

Alta Murgia PA has a dominant semi-/natural rocky dry grassland which hosts endemic and priority habitats of community interest. It is frequently subjected to fire events during summer season, hence, Burn Severity index was considered. Period investigated: 2004-2018.

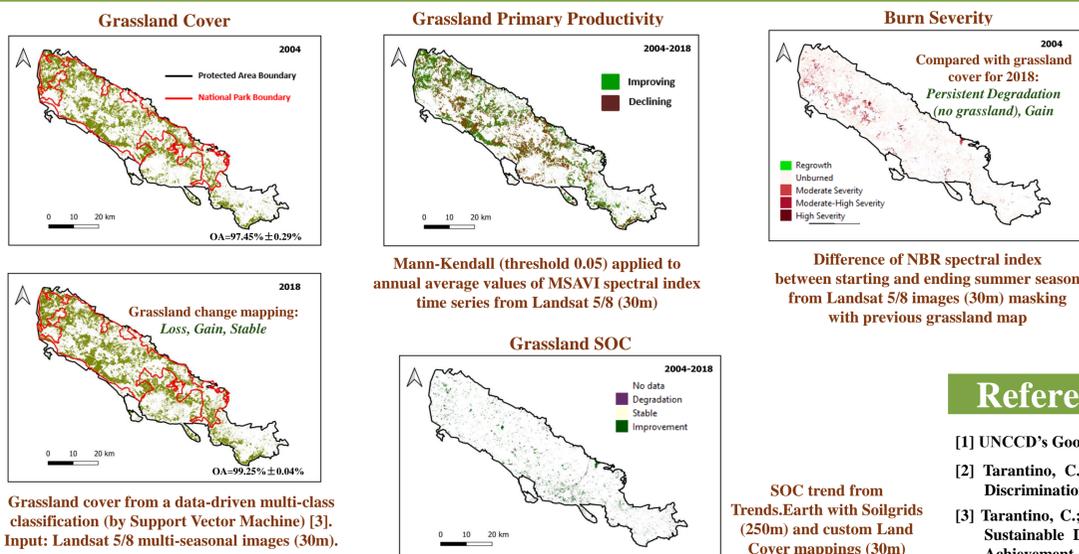

SDG 15.3.1 indicator: methodology

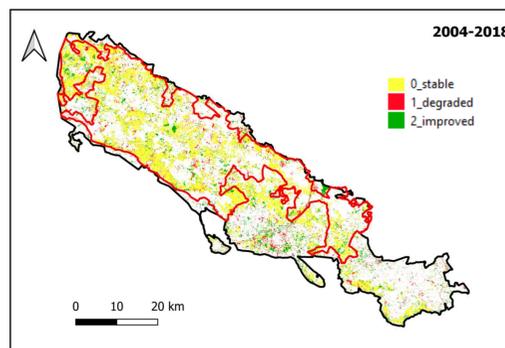

UNCCD: the three main sub-indicators are integrated by the principle “One out, All out” (10AO) obtaining a 3-class mapping - Degraded, Improved, Stable

Sub-indicators from satellite data

SDG 15.3.1 indicator: computation

$$SDG\ 15.3.1\ \% (P_n) = \frac{A(Degraded)_n}{A(Total)}$$

where:
 P_n = proportion of land degraded at time t_n since the baseline t_0 ;
 $A(Degraded)_n$ = total land degraded at t_n computed as:
 $A(Degraded)_n = A(Recent\ Degraded)_n + A(Persistent\ Degraded)_n - A(Improvement)_n$
 $A(Total)$ = total land considered

SDG 15.3.1 % (2004-2018) = 15.63%
