THE ELEPHANT IN THE ROOM

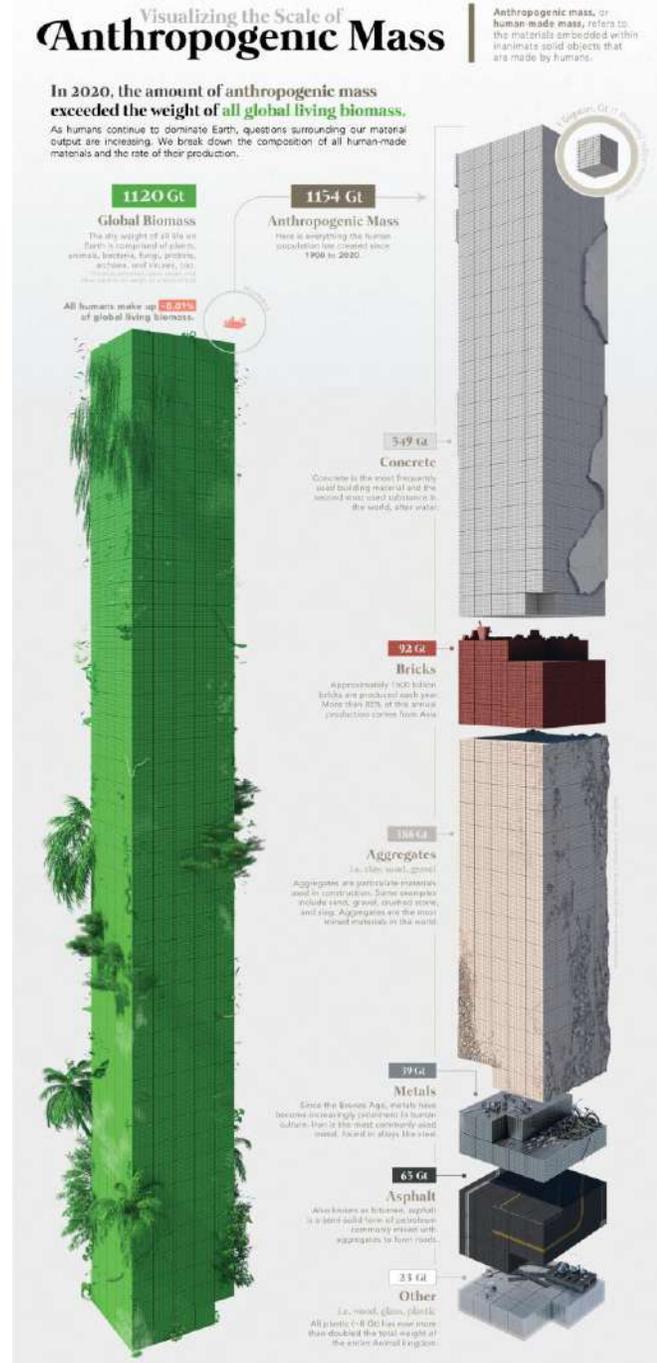

Article

Global human-made mass exceeds all living biomass

Elhacham et al. 2020 Nature

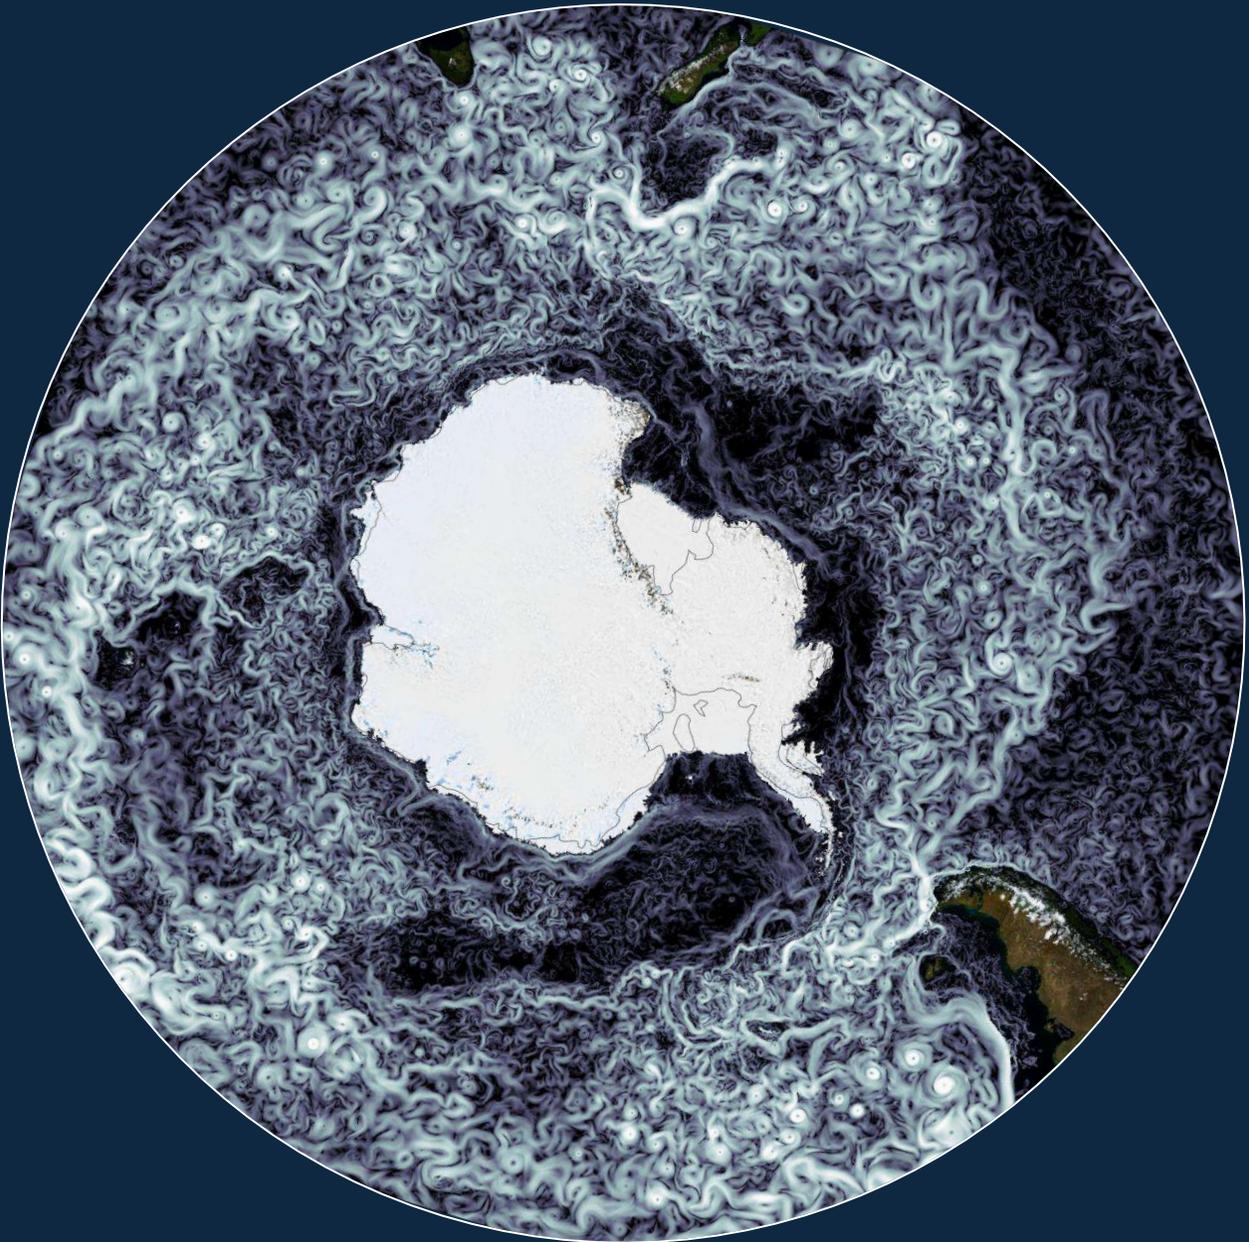

«The global mass of produced plastic is greater than the overall mass of all terrestrial and marine animals combined.»

Fraser et al. 2016

FESOM2 ocean model (<https://fesom.de/>)

Fig. 1. Boomerang-shaped piece of driftwood from the west coast of Macquarie Island identified as *Nothofagus ? pumilio*; this appears to have been derived from a large limb. The piece was 4 ft. long, 6 in. tapering to 4 in. in diameter. (Photo. by H. Black)

Crossing of the Antarctic Polar Front (APF) by driftwood, pumice and fishing-related materials was reported in both directions since the early 1960s (Barber et al., 1959; Coombs and Landis, 1966)

Photo: Nico De Bruyn

The first records of microplastic ingestion by seabirds were from the Southern Ocean, when prions *Pachyptila* spp. were found to contain plastic in 1960 (Harper and Fowler, 1987)

BEACH LITTER AND MICROPLASTICS

- Macroplastics counted and collected on all visited islands.
- **86 items** from 6 antarctic and sub-antarctic beaches.
- Evidence of rafting organisms attached to floating debris.
- 180 sand cores collected from 13 sites.
- Only few fibers retrieved from the sand samples.
- No large MPs were found on the sampled beaches.

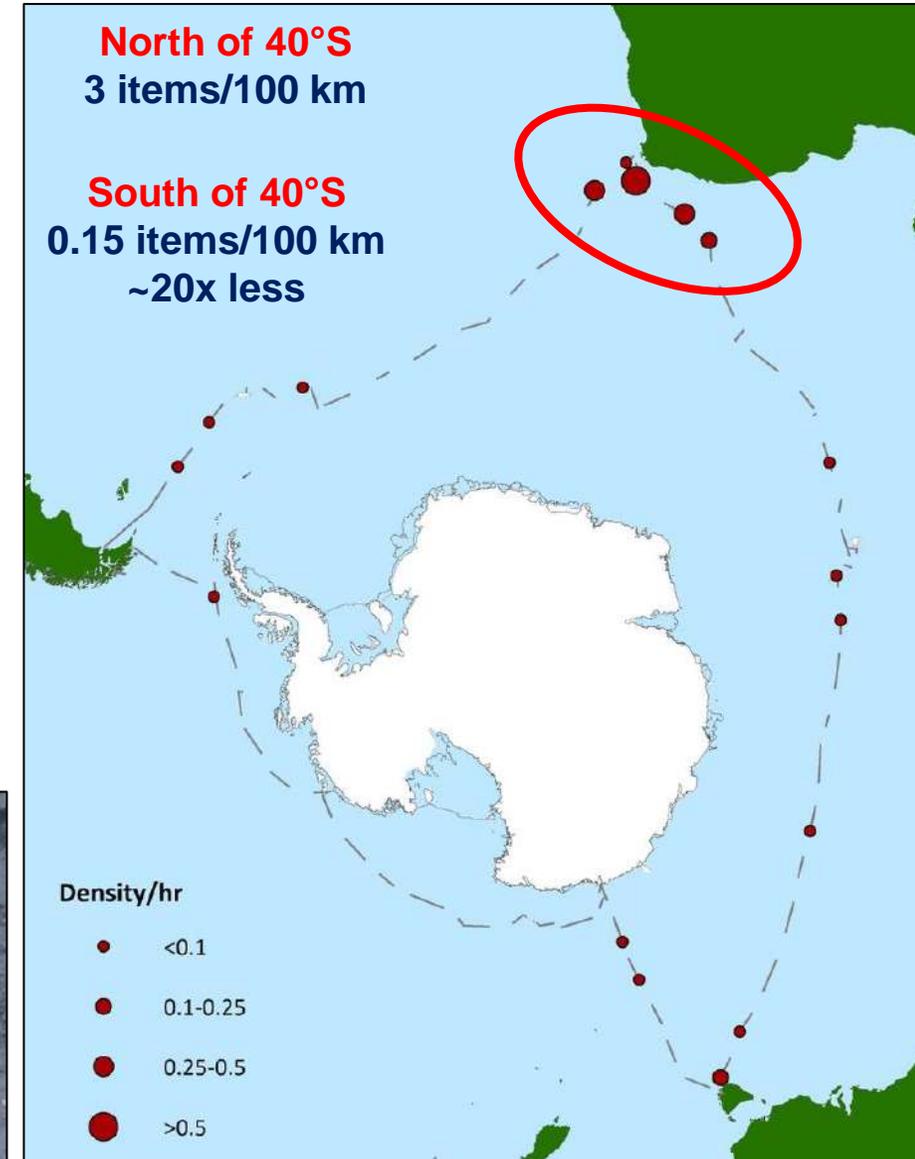

- Only 54 litter items in 15,417 km of visual survey effort (626 hrs)
- FML density in temperate waters (0.28–0.51 items·km⁻²) was an order of magnitude higher than in the SO (0.02–0.03 items·km⁻²). Only 2 items > 60°S

Drifting kelp was 50x more abundant than plastic litter.

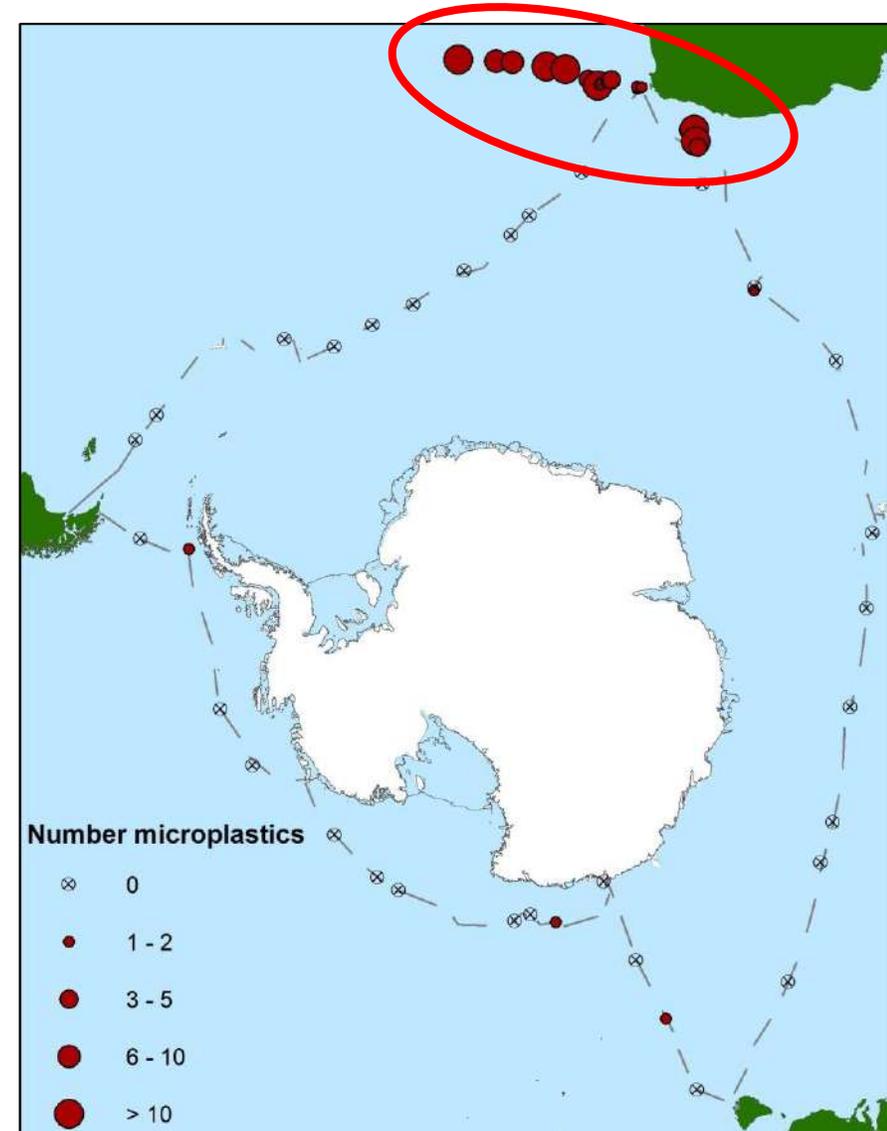

- **33 samples** collected (mesh size 200 μm)
- **115 particles extracted** and characterized (μFTIR)
- **94%** of these particles were paint chips or other non-plastic materials (organic, quartz, CaCO_3)
- **Only 7 microplastics found in 5 samples**
- FTIR identification: **PS, PVC, PE, PP, PA.**
- Mean plastic concentration: **~ 290 items/ km^2**

North of 40°S

- 22 additional samples (May-Jul 2017)
- **Microplastics found in 90% of samples**
- **Average concentration: ~ 1350 items/ km^2**

(i.e. $\sim 5x$ more than in the SO)

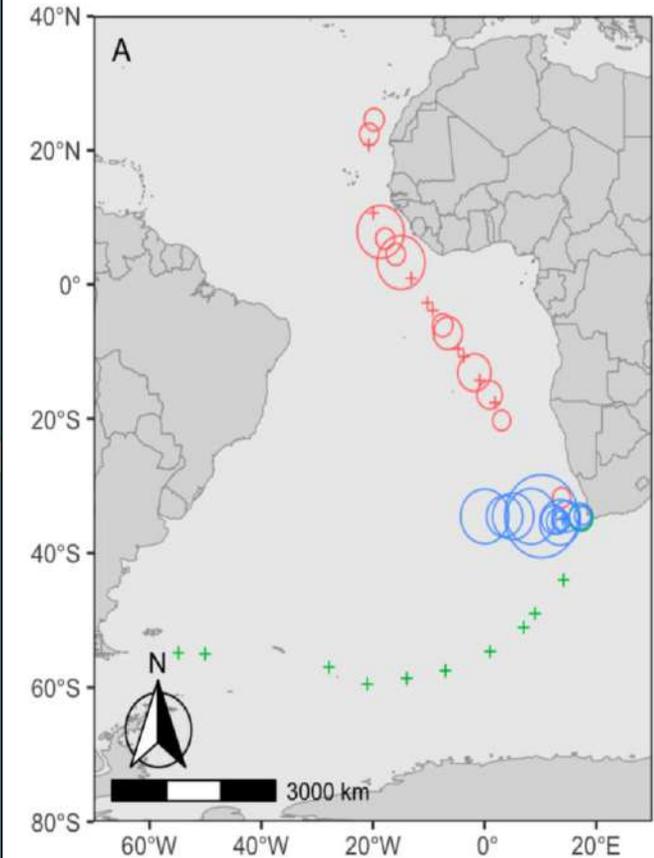

Atlantic Ocean (ACE Leg 0): ~2,500 microplastics/km²

(~10x more than SO)

Mediterranean Sea: 1,250,000 microplastics/km² (Suaria et al., 2016)

(~5000x more!)

(Suaria et al., 2023)

**The world's cleanest
ocean?**

The Research Expedition Vessel «Akademik Tryoshnikov»

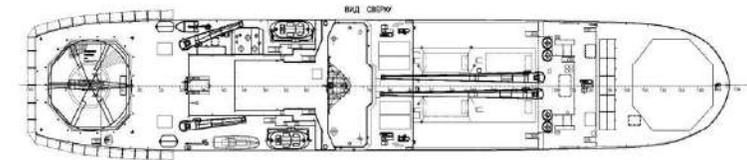

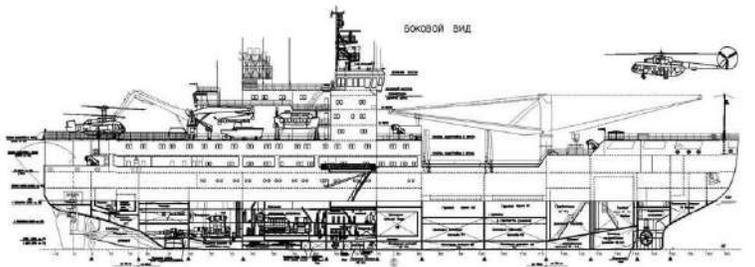

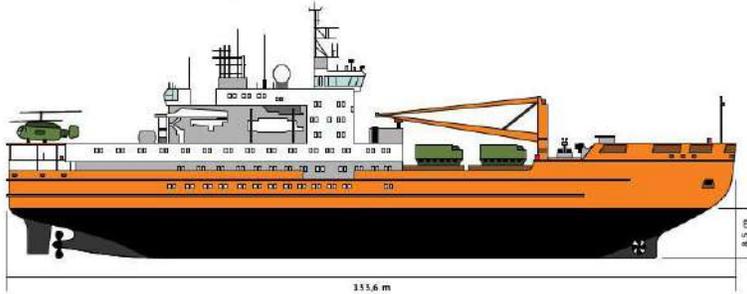

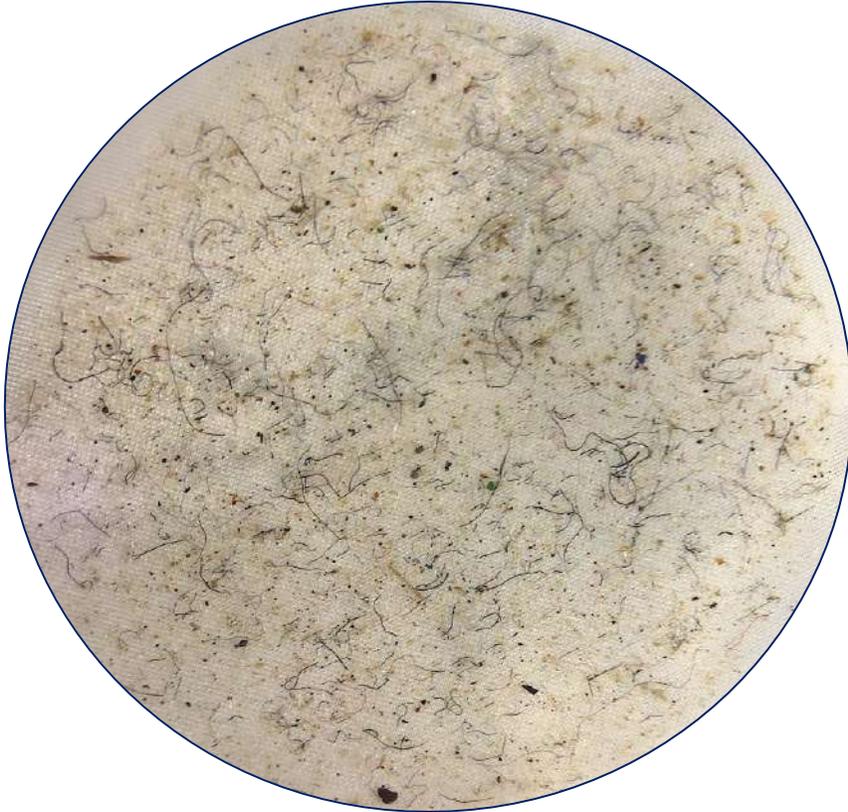

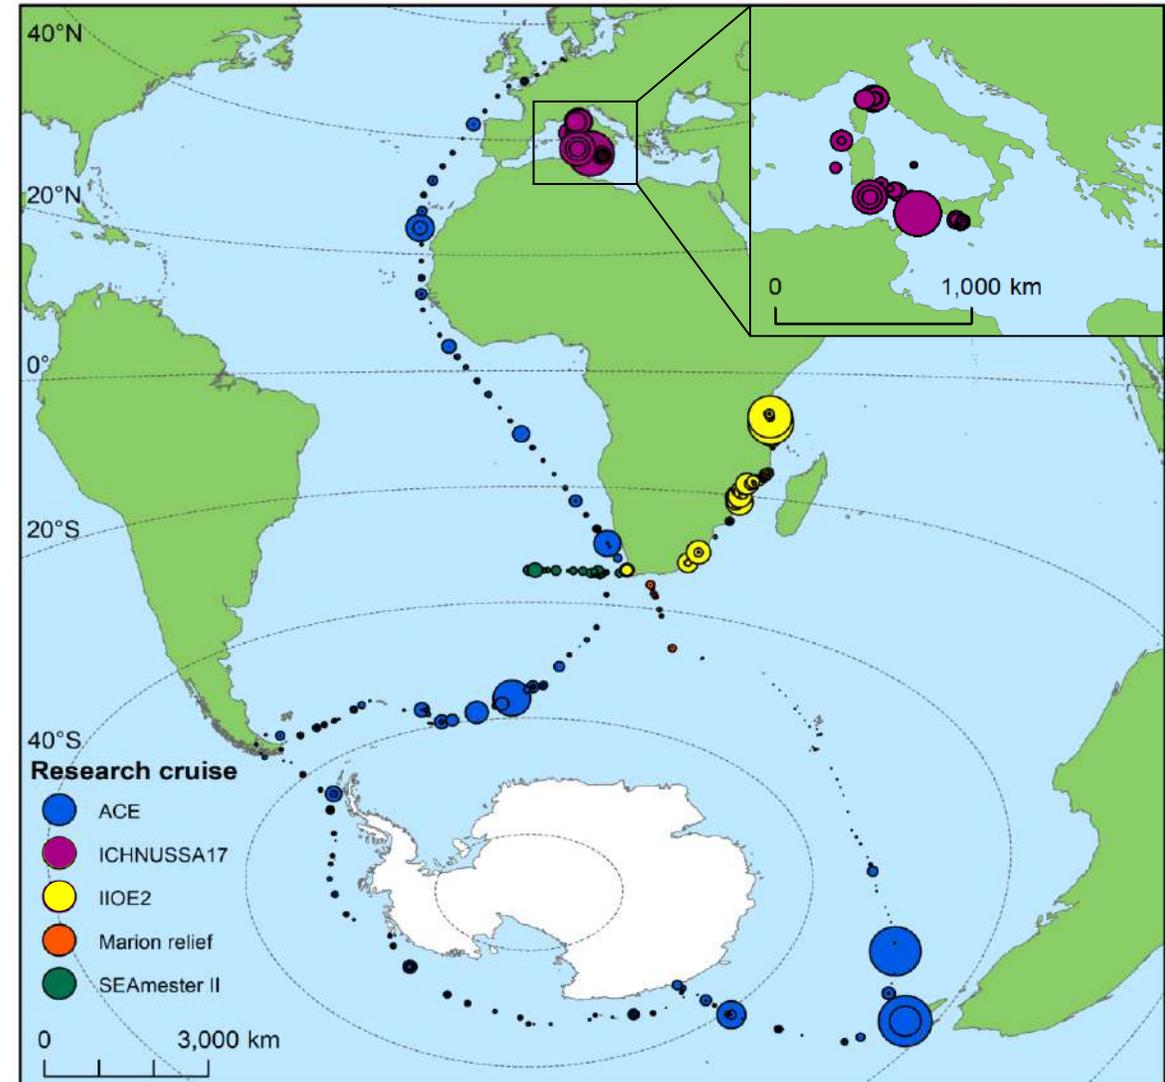

Рис. 1. Научно-экспедиционное судно (пр.22280)

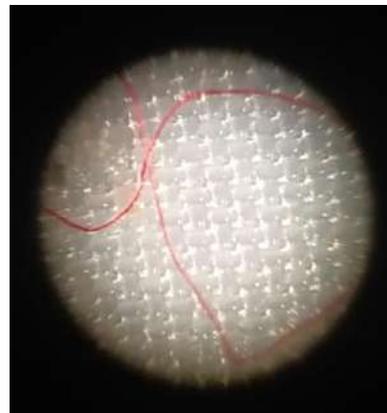

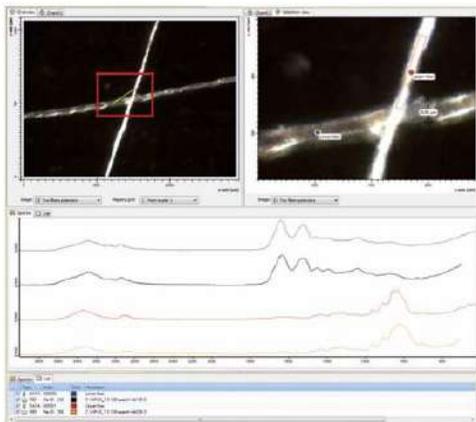

- 5 research cruises between January and November 2017.
- **916 seawater samples** collected at 617 locations.
- 2/3 replicates per station were usually collected
- Water was poured into 10-liters pre-washed containers for on-board gravity or vacuum filtration through 0.7-63 μm mesh filters.

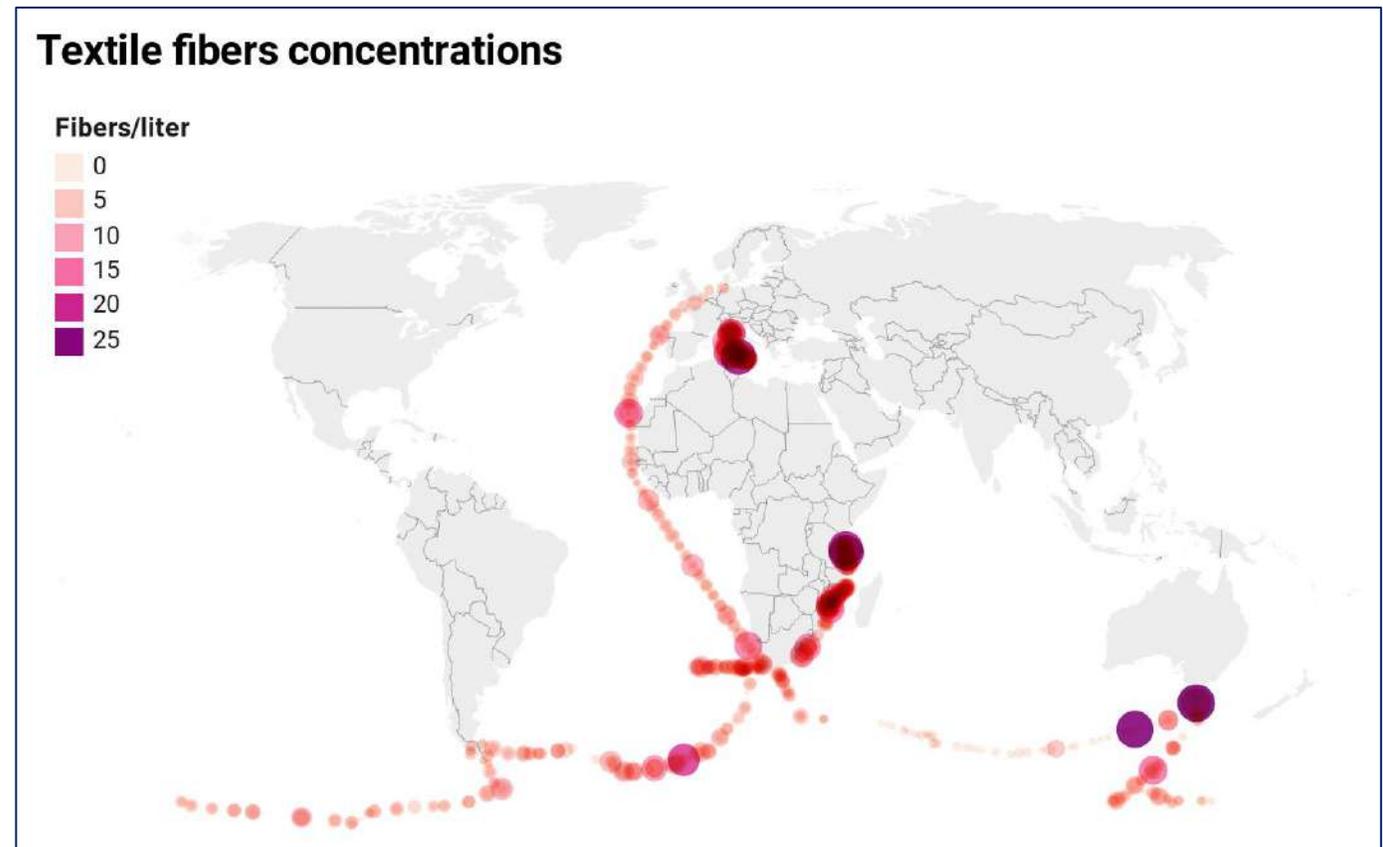

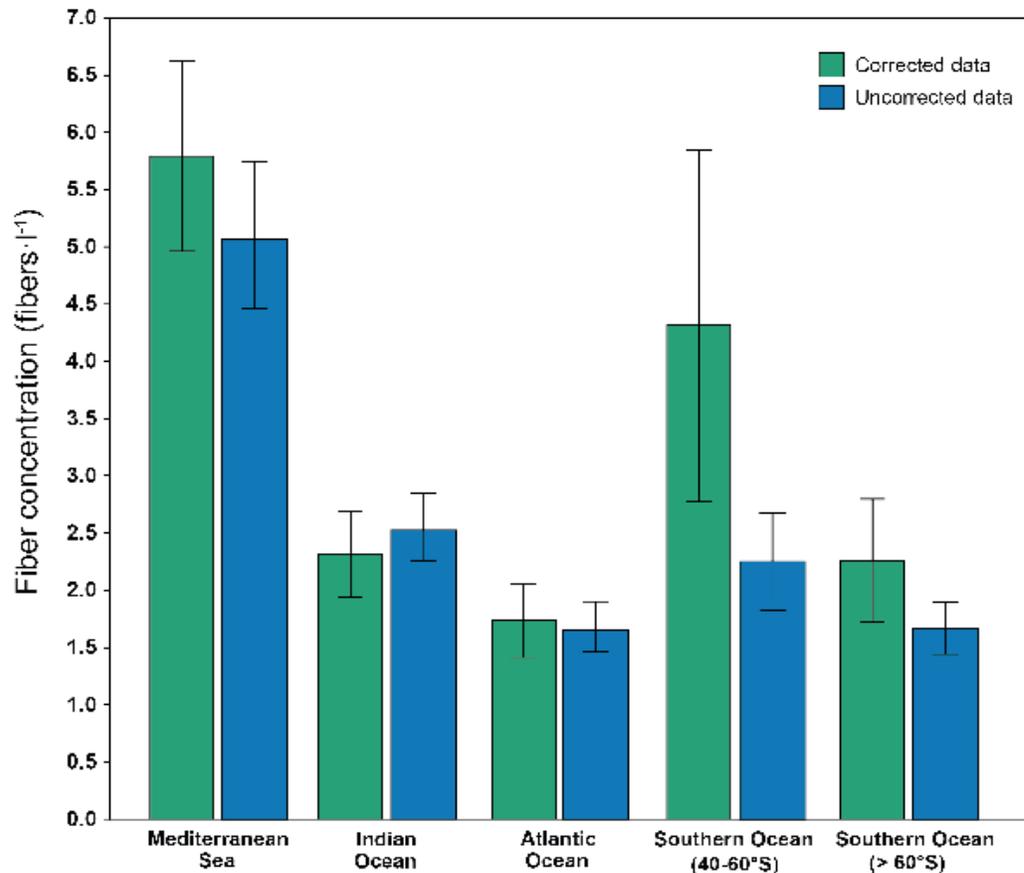

LABORATORY ANALYSIS

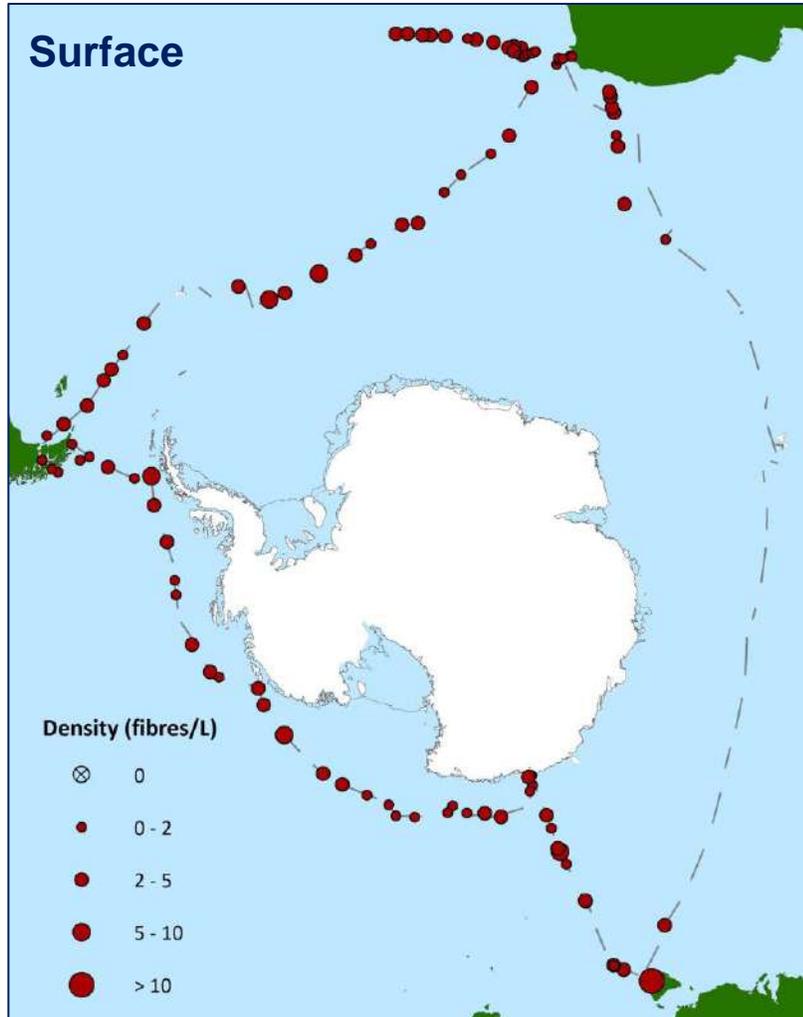

- Counting and sorting at the stereomicroscope according to standard criteria.
 - Raw fiber concentrations computed for all samples and expressed as fibres·l⁻¹
 - A random subset of **2134 fibres** (i.e. ~10 fibres/sample) extracted for μ FTIR analysis (Bruker LUMOS in ATR-mode).
 - Fiber length and diameter measured to the nearest 1 μ m from the digital images collected by the instrument.
 - Fibres classified as: **Synthetic** (polyester, acrylic, polyamides, etc.), **Animal** (wool, silk) or **Cellulosics** both natural (cotton, linen, jute, kenaf, hemp, flax, sisal) and man-made (rayon/viscose, acetate).
- **23,593 fibres counted**
 - Fibres found in 99.7% of samples
 - Range: 0.02-25.8 fibres·l⁻¹
 - Median 18 fibres/sample
 - Q₁-Q₃ : 10-31
 - Median concentration: **1.7 fibres·l⁻¹**

- **Fiber concentration was not homogenous across ocean basins.**
- High concentrations were found in the Mediterranean Sea and in the SO
- No clear trend in relation to distance with land, but fibers concentration tended to increase from north to south (negative correlation with latitude).

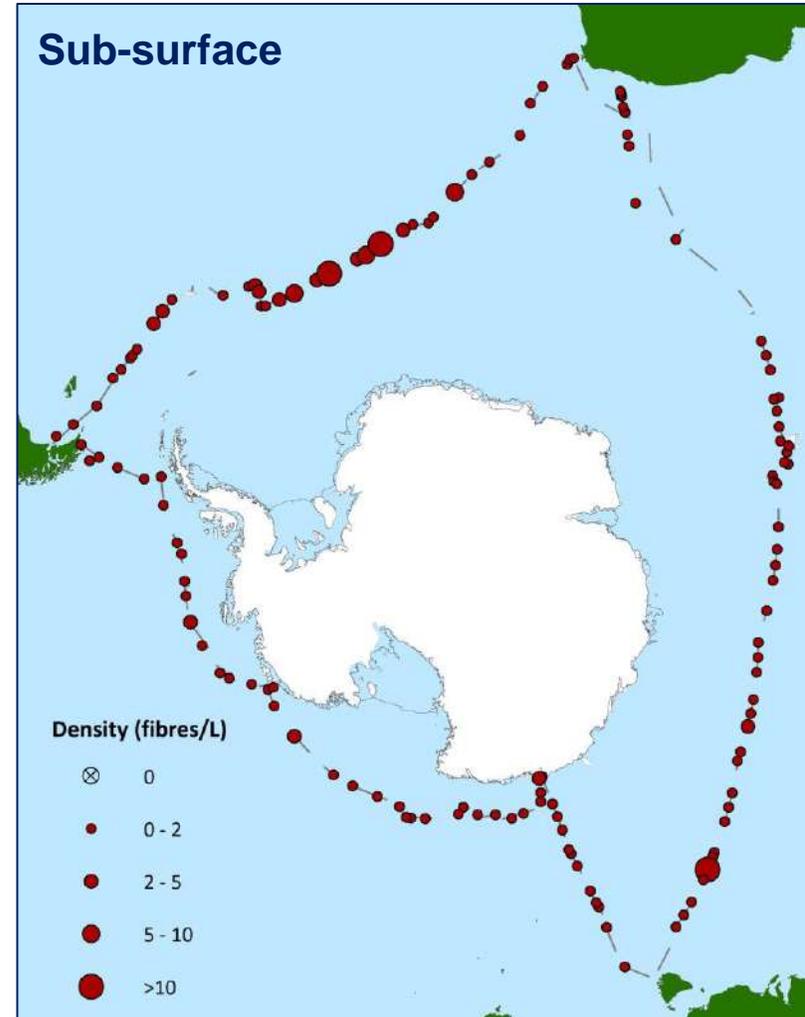

Bulk water samples

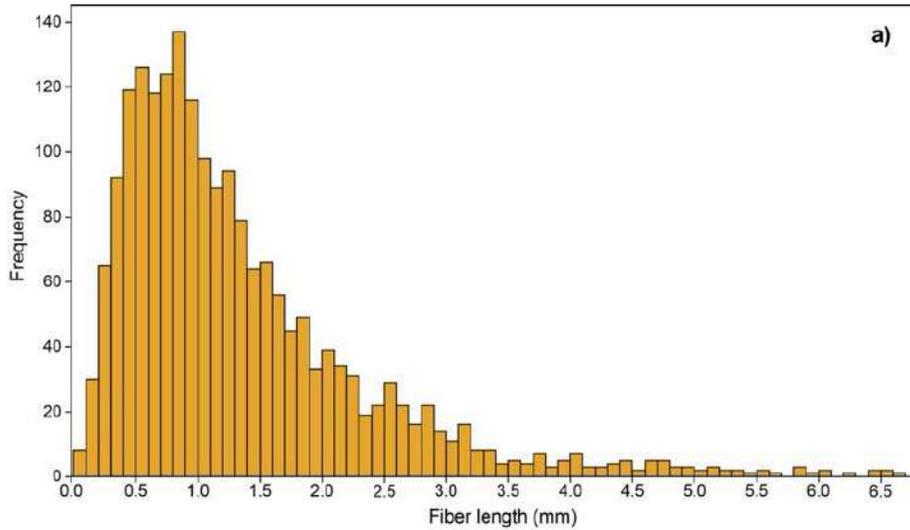

North of 40°S: 2.0 fibres/litre
South of 40°S: 2.7 fibres/litre
~1/3x more

Underway samples

North of 40°S: 0.3 fibres/litre
South of 40°S: 1.3 fibres/litre
~5x more

LENGTH AND DIAMETER

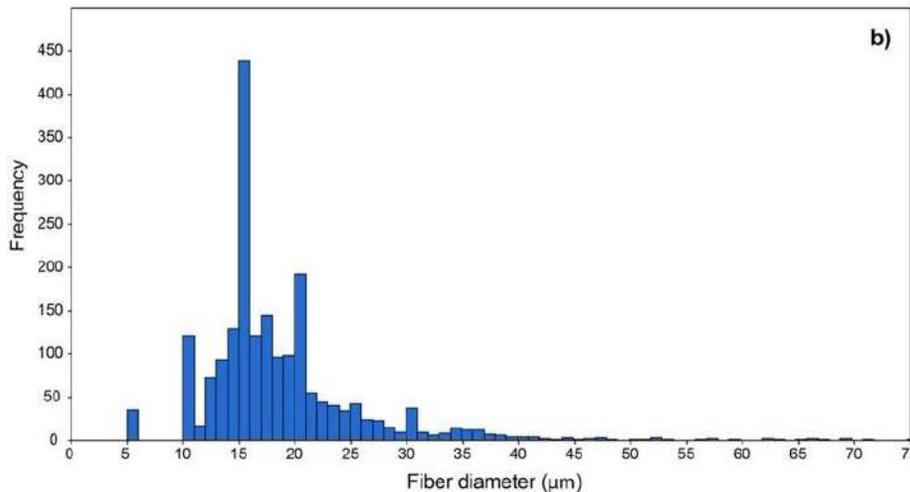

Length

- median 1.07 mm
- Q_1 - Q_3 : 0.65 to 1.74 mm
- range: 0.09–27.06 mm
- only 10 fibers > 10 mm
- only 3 fibers > 15 mm

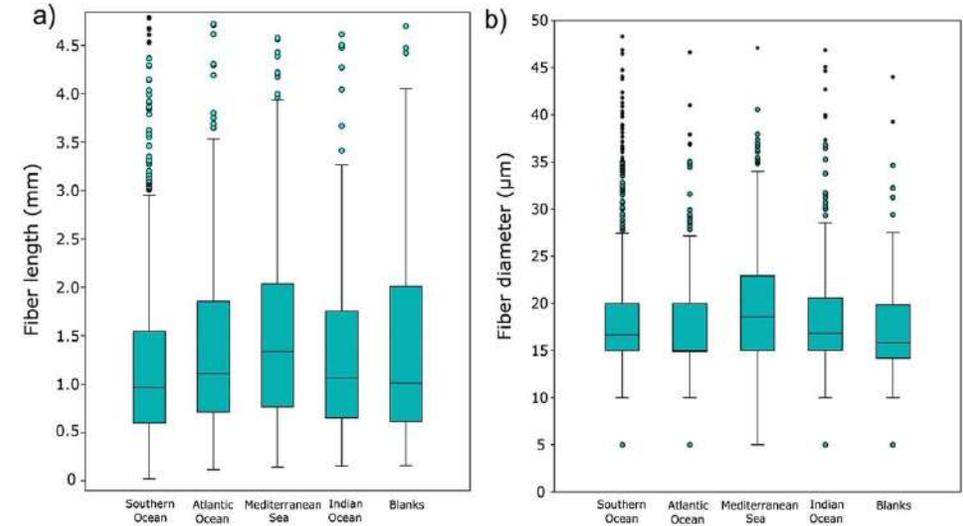

Diameter

- median 16.7 μm
- Q_1 - Q_3 : 15.0-20.4 μm
- range: 5-239 μm

Colors

- dark/black (57.1%)
- light/grey (24.2%)
- blue (10.1%)
- red/orange (5.2%)
- yellow/amber (2.9%)
- green (0.4%)

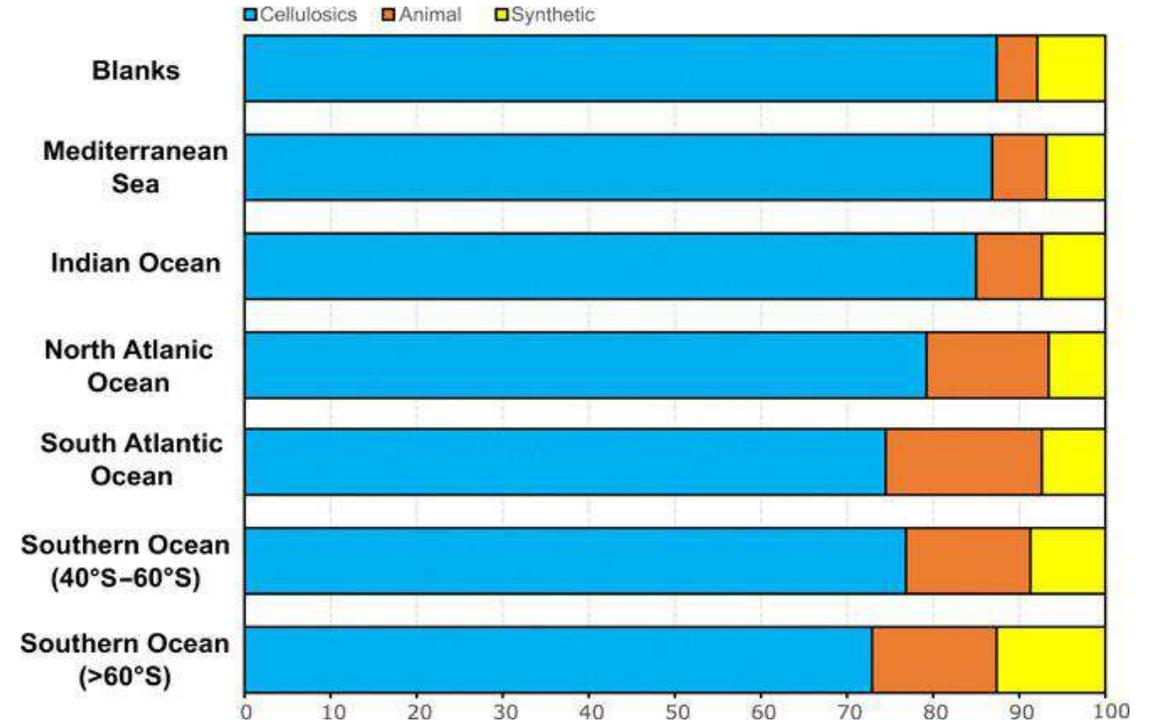

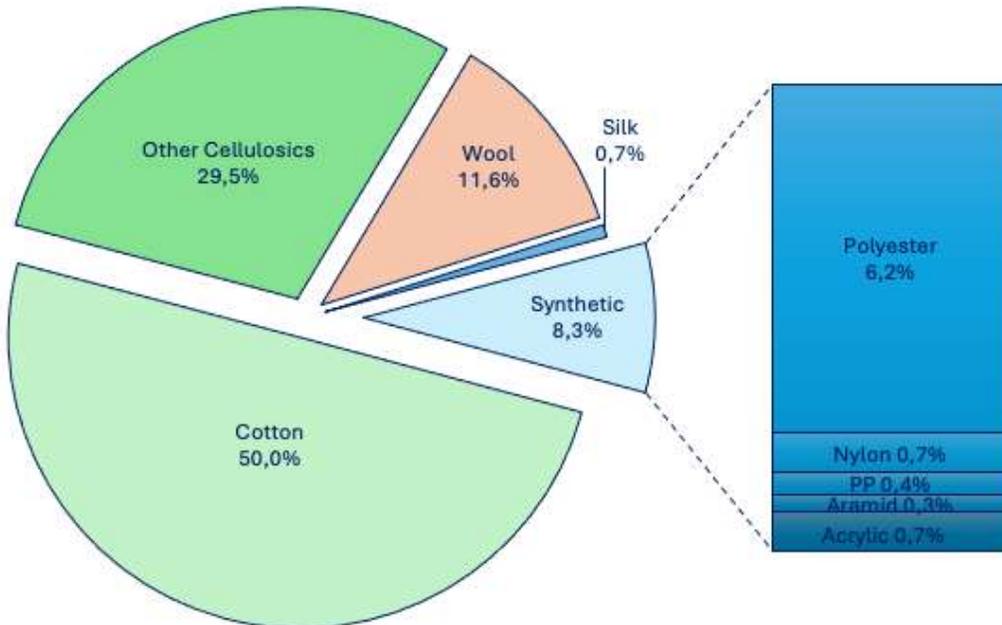

Fibers from the Mediterranean were significantly longer and thicker than those found in other basins.

Fibers from the Southern Ocean were significantly shorter than all other basins.

- **91.8% of all analyzed fibres (n=1984) were natural fibres of animal or plant origin.**
- Most fibres are non-synthetic: cotton 50%, wool 11.6% or other cellulosics 29.5%.
- **Only 8.3% synthetic**, with polyester the most abundant (6.2%), followed by nylon (0.7%), acrylic (0.7%), polypropylene (0.4%) and aramid fibers (0.3%).

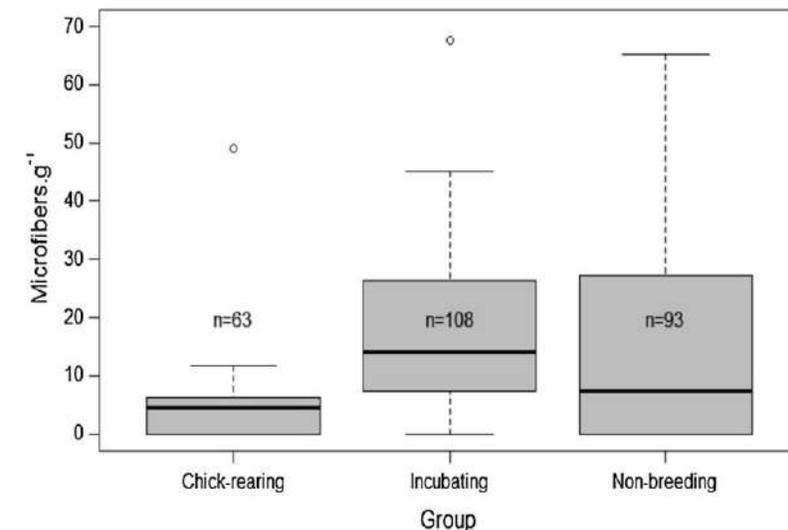

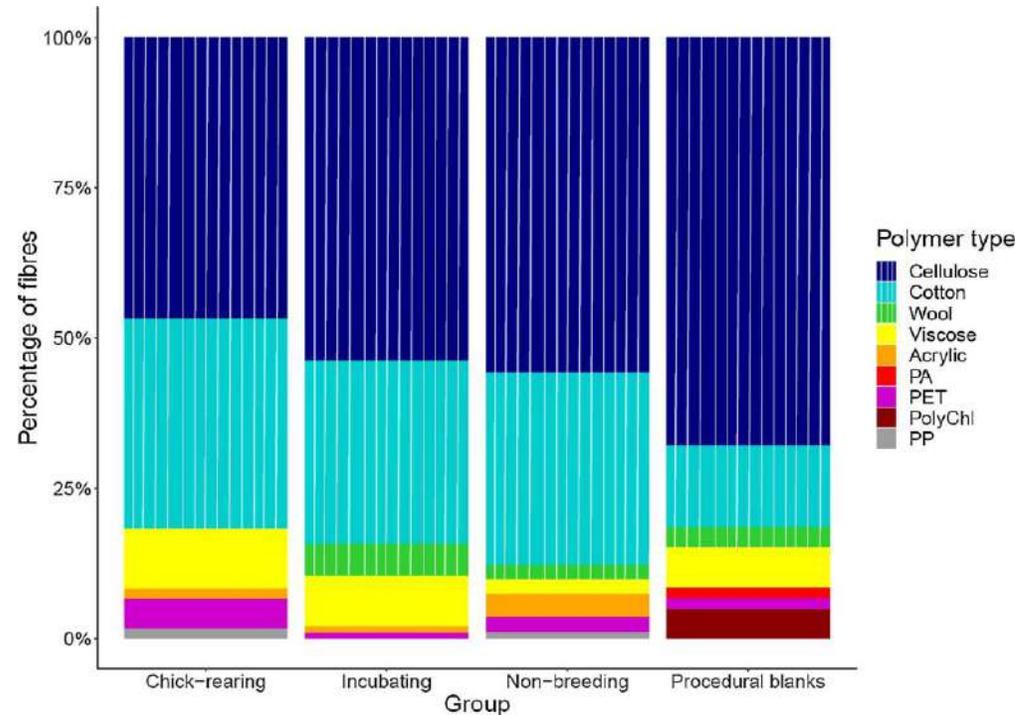

- The composition of fibers was not homogenous across ocean basins, but the general trend remains constant (cellulosics >70-80% in all oceanic basins).
- **The proportion of synthetic fibers increased at higher latitudes** from 6.8% in the Med to 12.6% in Antarctic waters south of 60°S (similar pattern for wool fibres).

NATURAL AND SYNTHETIC FIBRES IN THE DIET OF KING PENGUINS (*APTENODYTES PATAGONICUS*) FORAGING FROM SOUTH GEORGIA

- Microfibres were found in 77% of the King Penguin faecal samples collected at South Georgia.
- Most microfibres (88%) were of natural origin (e.g. cellulose, cotton, wool).
- Faeces of incubating penguins were twice as contaminated as samples from chick-rearing birds.

Fibers are the most prevalent type of anthropogenic particle found by microplastic pollution surveys around the world, including Antarctica, consistently accounting for **80-90% of 'microplastics' counts** in all compartments surveyed.

Not only clothes and not only washing machines...

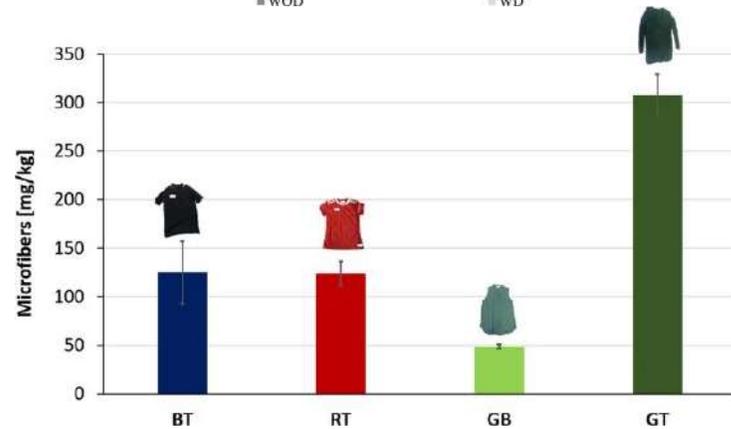

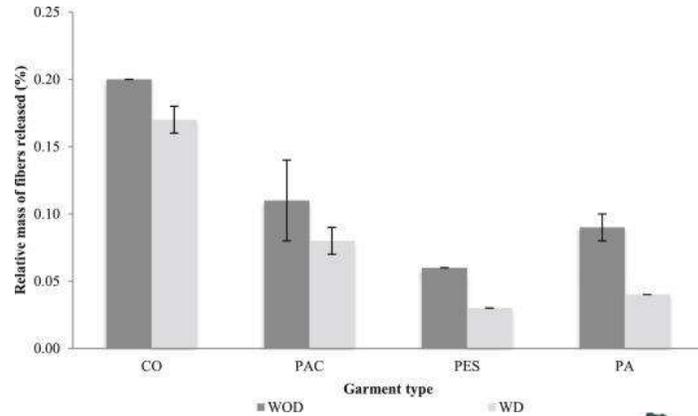

- The main uses of natural and synthetic fibers are clothing and apparel, followed by household and furnishings, automotive and other industrial applications, e.g. construction, filtration, and personal care.
- Large numbers of fibers are discharged into wastewater from washing clothes (10^{7-9} fibers per wash).
- But it is very likely that washing machines are not the largest source of fibers...

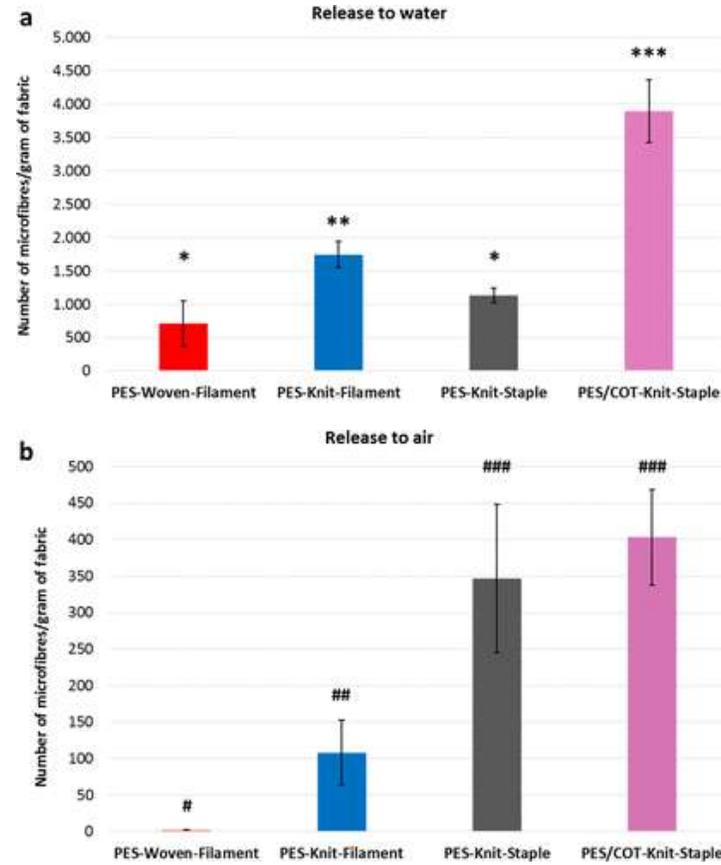

Pauly, John L., et al. "Inhaled cellulosic and plastic fibers found in human lung tissue." *Cancer Epidemiology and Prevention Biomarkers* 7.5 (1998): 419-428.

87% of the studied lungs (n = 114) contained fibers
97% of malignant lung specimens contained fibers

Release from washing (Zambrano et al. 2019; Cesa et al. 2019; De Falco et al. 2019)

Release to air by wearing clothes (De Falco et al. 2020)

Examining the release of synthetic microfibres to the environment via two major pathways: Atmospheric deposition and treated wastewater effluent

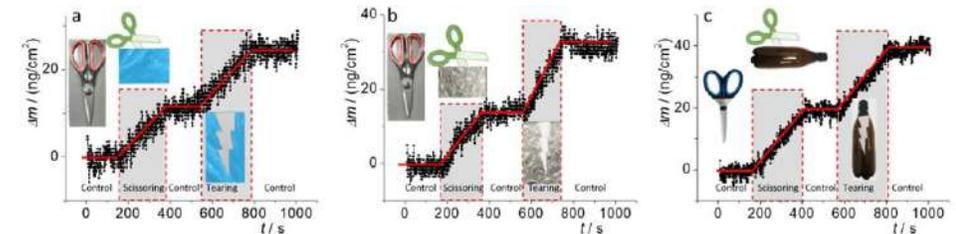

I.E. Napper^{a,1}, F.N.F. Parker-Jurd^{a,*}, S.L. Wright^b, R.C. Thompson^a

SUMMARY

- Most macro-litter found in Antarctica is locally produced (i.e. fisheries and research activities)
 - The long-range transport of FML and large secondary microplastics is probably limited in the SO.
 - On the contrary, small MPs and textile fibers are most easily transported in the atmosphere from lower latitudes and are contaminating the Antarctic Environment.
- 
- A large, rectangular ice shelf floats in the dark ocean under a cloudy, dimly lit sky. The ice shelf is illuminated from the side, showing its texture and the way it reflects the light. The water is dark and calm, with some smaller ice floes visible in the distance.
- The main knowledge gaps are related to deposition rates, local generation mechanisms, environmental impacts, exposure levels for biota, degradation times and sinking mechanisms.
 - Harmonization and standardization of sampling and analytical protocol is critical to ensure intercomparability of the results and a proper assessment of MP pollution levels in Antarctica.
