

## Frailty trajectories in patients taking statins: A propensity score-matched cohort study using UK primary care data

Eleanor Hathaway, Aditya Acharya, Krishnarajah Nirantharakumar Institute of Applied Health Research, University of Birmingham

## Background

**Frailty** - "a state of increased vulnerability... following a stress, which increases the risk of adverse outcomes including falls, delirium and disability"<sup>1</sup>

Affects 26% aged 85 and over in UK<sup>2</sup>, increases healthcare costs, rise with increasing severity<sup>3,4</sup>

Design	Propensity score-matched open cohort study	
Database	<b>Clinical Practice Research</b>	
	Datalink (CPRD) GOLD	

## Methods

Adjusted\* hazard ratio

- Primary care recommended to identify & measure frailty using the electronic frailty index (eFI); calculated automatically from GP records<sup>5,6</sup>
- Some medications shown to reduce frailty<sup>7,8</sup>
- Statins: many effects beyond cholesterol reduction including anti-inflammatory, reduced mortality and reduced incidence dementia<sup>9</sup>

Aim

- To examine the association between statin exposure and change in frailty severity over time
- 2 cohorts of 210,643; statin-exposed & unexposed
- Balance of baseline characteristics similar
- Median age: 73.5 yrs in exposed & 72.9 yrs in unexposed
- Higher proportion female (54.6% exposed, 54.3% unexposed)
- 40% white, just under 7% black/African/Caribbean/Black British and less than 1% Asian/Asian British in both cohorts. Ethnicity data missing for  $\sim$  50%.
- Mean BMI 27.3 (overweight category) in both groups
- 11.4% exposed & 11.3% unexposed were current smokers
- Median baseline eFI score 0.14 (mild frailty) both cohorts

Table 1: eFI scor	e & eFI severity ca	ategories at study	exit	
	Statin- exposed	Unexposed	p-value	
	(210,643)	(210,643)		
eFI score	0.19	0.17	-0.001	
(Med, IQR)	(0.11-0.25)	(0.11-0.22)	< 0.001	
<b>eFl category</b> (n(%))			<0.001	
Fit	54,621 (25.9)	69,502 (33.0)		
Mild	98,108 (46.6)	90,931 (43.2)		
Moderate	51,171 (24.3)	45,202 (21.5)		
Severe	6,743 (3.2)	4,691 (2.2)		
	Referer			

	1	(95% CI)
Statin exposure		
Statin unexposed	•	1.00 [ 1.00, 1.00]
Statin exposed	•	1.07 [ 1.05, 1.09]
Sex		
Vale	•	1.00 [ 1.00, 1.00]
Female	-	1.04 [ 1.01, 1.06]
Age category		
65-74	•	1.00 [ 1.00, 1.00]
75-84		2.31 [ 2.27, 2.36]
35 and over		3.87 [ 3.75, 3.99]
Ethnicity		
White	•	1.00 [ 1.00, 1.00]
Black/African/Caribbean/Black British		1.30 [ 1.26, 1.34]
Asian/Asian British	+	1.33 [ 1.20, 1.48]
Mixed/Multiple ethinic groups		0.98 [ 0.62, 1.56]
Other	-	1.16 [ 1.09, 1.25]
Vissing	•	0.88 [ 0.84, 0.92]
Townsend deprivation score		
Quintile 1 (most affluent)	•	1.00 [ 1.00, 1.00]
Quintile 2	+	1.01 [ 0.98, 1.05]
Quintile 3	+	0.99 [ 0.96, 1.02]
Quintile 4	•	0.94 [ 0.90, 0.97]
Quintile 5 (least affluent)	-	1.06 [ 1.03, 1.10]
Missing		0.46 [0.12, 1.84]
BMI category		
Normal (18.5-25 kg/m2)	+	1.00 [ 1.00, 1.00]
Under weight (<18.5 kg/m2)	-	1.20 [ 1.12, 1.30]
Overweight (25-30 kg/m2)	•	0.95 [ 0.93, 0.97]
Obese (30 kg/m2 and over)	-	1.12 [ 1.09, 1.15]
Missing		0.88[0.84_0.92]

- Statins may be associated with increased frailty progression in those over 65.
- **7% increased hazard seen** for an increase in eFI severity category in statin exposed group
- Increasing age, female sex, black or Asian ethnicity, obese BM, current smoking and being in the least affluent Townsend quintile all increased the hazard
- Median eFI score at study exit higher in statin exposed – 0.19 compared to 0.17.
- Fewer in exposed cohort remained in the fit category, more progressed to all other severity categories.

•This study has shown it is possible to calculate frailty scores over time to determine trajectories using routinely collected primary care data •Frailty incidence, prevalence and associated costs set to increase significantly, identifying potential treatments & exacerbators will be of growing importance for patients and policymakers.

## Strengths and limitations

> Strengths:

Figure 1: Forest plot - adjusted hazard ratios for eFI score change  $\geq 0.12$  (change in category)

Large sample size, representative of UK population

Propensity score matching used

> eFI scores calculated at regular intervals using electronic health record data

Limitations:

- $\succ$  eFI may be less accurate than other frailty measures e.g. clinical assessment
- $\succ$  eFI unable to detect improvements
- Missing data levels high for some covariates
- Residual unmeasured confounders may be affecting outcome
